

# Trade and Informality

**Marco Fugazza**

UNCTAD

WTO-ILO Workshop, Geneva August 31, 2009

# Informality at a Glance

- General definition:
  - Informal firms do not comply with government regulations and are unregistered
  - However, informal activities can be conducted by registered firms (share of production hidden from fiscal authorities)
- Main characteristics of informal (unregistered) firms:
  - Small size (less than 5 employees, large share of self employment)
  - Low productivity compared to their registered counterparts
  - Limited access to finance and public goods
  - Do not export (self-employed produce essentially non tradables)
  - Participation can be voluntary
- More informality is not a good sign whatever the view we have of the role of unofficial firms in development

# Informality and Trade

- What is the role of informal firms in the production of exported goods?
  - At best they produce inputs but sounds like an exception
- What is the impact of trade liberalization on informal firms and informal activity?
  - The conventional view poses that trade liberalisation would cause a rise in informality
  - However recent theoretical developments and empirical evidence have challenged this view

# Informality and Trade Liberalisation: Empirical Evidence (micro)

- Empirical evidence on the relationship between trade liberalisation and informality is limited and generally country specific (micro data)
- Most of the evidence relates to Brazil, Colombia and Mexico for which rich, relevant and reliable micro datasets are available
- Empirical studies suggest that informality can respond to trade liberalisation either positively or negatively, depending on country and industry characteristics (economic and institutional)

# Informality and Trade Liberalisation: Empirical Evidence (macro)

- Less restricted trade is associated with a larger share of informal output
- Less restricted trade is associated with a lower share of informal labor
- Results are obtained in a dynamic panel set-up and are robust to a series of changes in specification, controls and reference sample
- Results can suggest that unregistered activity has fallen with trade liberalisation but underground activity in registered firms has increased

# Research Agenda I: Theory

- No existing theoretical framework is able to replicate macro empirical findings: the sign of the relationship is the same for any dimension of informality in all models
- The real (modeling) issue seems to be undeclared production (/employment) in registered firms:
  - Lower informal employment (ILO definition) may be seen as a good news if workers move to formality (higher labour productivity)
  - However, the overall incidence of precarity may have remained the same or even worsened

# Research Agenda II: Empirics

- More needs to be known about the relationship between informal firms and the external sector: increase the country coverage of World Bank's Micro and Informal surveys (and perhaps adapt the questionnaires)
- Establishment of a reference database based on macro (indirect) estimated measures of informal activity across countries

# Research Agenda III: Policy

- En vogue: “Formalization” of informal firms
- However, formal entrepreneurs are better skilled than informal ones => main constraint to formalization
- The best way to formalize may be to promote and support job creation in the formal sector especially in times of policy reform like trade liberalization
