ACKNOWLEDGEMENT

This Assessment of the Working Time Demonstration in SCORE Programme Factories in Indonesia was funded by the International Labour Organization (ILO). In implementing the assessment, the researchers benefitted greatly from the advice and guidance of Jon C. Messenger, the project officer and Team Leader, Working Conditions Group, Conditions of Work and Equality Department, Inclusive Labour Markets, Labour Relations and Working Conditions Branch (INWORK) at the ILO. We are grateful for his support and encouragement throughout.

Throughout the project we also received guidance and support from Michael Elkin and Andrea Prince of the Sustaining Responsible and Competitive Enterprises (SCORE) Programme in the ILO's Enterprises Department (ENTERPRISES). We greatly appreciate their support and valuable comments to improve this report.

We are also grateful for the exemplary work of Edy Irianto who directed and implemented the survey data collection for IMPAQ in Indonesia. In addition, we acknowledge and are grateful for the support and resources provided by Januar F. Rustandie, National Project Manager, SCORE, ILO Jakarta, Indonesia.
1. INTRODUCTION

Working time issues have been important in the history of the ILO. In fact, the first ILO Convention: the Hours of Work (Industry) Convention, 1919 (No. 1) deals with working time. Following this first convention, ILO continued to emphasize standards in the area of working time focusing on such issues as hours of work, weekly rest, night work, paid annual leave, and part-time work.

In recent years, working time issues have again risen to prominence. In October 2011, the ILO convened a Tripartite Meeting of Experts on Working-time Arrangements to review and advise on modern working-time arrangements. The Meeting unanimously adopted a set of Conclusions that outline a future course of ILO action in the area of working time.

In March 2012, the ILO Governing Body discussed the Follow-up to the Tripartite Meeting of Experts on Working-time Arrangements. The Governing Body authorized the Director-General to publish the Conclusions of Working Time in the Twenty-first Century and requested that the ILO Director-General, when drawing up proposals for the future work of the ILO on working time, do so based on the Conclusions. Since then, the ILO has developed a Global Product on Working Time in the Twenty-first Century. The purpose of this is to strengthen the ILO’s capacity to provide guidance to constituents regarding how to develop working time arrangements that can effectively balance workers’ needs with firms’ performance requirements. Since that time, the focus of the ILO has been on conducting research to better understand the contribution of innovative working time arrangements to organizational performance and workers' work-life balance.

In addition to promoting work sharing to improve the work-life balance of workers and improve productivity and hence profitability for employers, the ILO has also promoted the use of work sharing as a strategy to preserve jobs, especially during economic downturns. The most recent ILO contribution to the work sharing literature is Work sharing during the Great Recession, New developments and beyond – edited by ILO researchers Jon C. Messenger and Naj Ghosheh (ILO, 2013). This volume examines the use of work sharing as a job preservation strategy during the Great Recession of 2008–09. In addition, the book analyzes the experience of work sharing programs in a number of developed countries and provides insights on lessons learned from these country experiences and the implications for the use of work sharing in the future.
2. WORKING TIME DEMONSTRATION

2.1 Assessing Working Time in Indonesia

To date, assessments of working time programs have focused mainly on the experience of highly developed economies. To the best of our knowledge, the current study is the first-ever assessment of a working time program in a developing economy and in small and medium-sized enterprises (SMEs). Indonesia is a developing economy with a labor force of 104 million. Law 13 of 2003 provides workers with certain worker rights; however, the provisions of the law are not rigorously enforced and a large number of workers have no legal protection. A World Bank study in 2010 found that only 39% of Indonesia’s labor force is in the formal sector and the rest in the informal sector. Those in the informal sector have little worker protection.

The present study reports on the results and learning from the Working Time Demonstration in Indonesia. The demonstration was carried out to assess the effect of working time consulting and training on the work-life balance of workers, their satisfaction with various aspects of their jobs, and on the productivity and profitability of enterprises. The demonstration provided training and consulting for employers and employees on working time arrangements that can enhance employers’ productivity and profitability and, at the same time enhance workers’ work-life balance. Thus, the services provided during the Working Time Demonstration were designed in the belief that there is a potential to create a win-win situation for workers and employers.

It should be noted that the Working Time Demonstration is a demonstration or pilot project, and what is being assessed is not working time training and counseling per se, but rather the effects of developing and implementing new work schedules/working time arrangements on business outcomes and worker outcomes. Initial training was provided by the ILO while ongoing consultancy services are being provided by SCORE trained consultants who are providing consultancy services on working time arrangements to ILO.

The project originally included eight SMEs in Jakarta that volunteered to participate in the working time demonstration. Since these eight SMEs volunteered for the demonstration, they are self-selected. This self-selection may have important implications for the results. That is, these self-selected firms may be particularly receptive to adopting improved working time arrangements.

The demonstration began with a two-day working time training program in Jakarta, Indonesia in February 2013. The training program was organized by the ILO with the assistance of the

2 Demonstration services were focused on employers; services were not offered to workers.
SCORE global and SCORE-Indonesia team. The participants were worker and management representatives of eight firms, ILO, SCORE team members, IMPAQ researchers, and other stakeholders (e.g., government representatives) in the Working Time Demonstration. In addition to participating in the training activities to launch the demonstration project, the IMPAQ research team visited selected participating firms to learn more about working conditions in SMEs in Indonesia and working time arrangements at the firms.

Following the mission, the IMPAQ research team, in close collaboration with the ILO, developed two survey instruments to collect baseline information from management and workers at the participating firms. The instruments were tested and then administered in-person by the IMPAQ research team under supervision of ILO staff. Management interviews were conducted with the owner and other top officials; the research team attempted to interview three managers at each firm. Worker interviews were conducted at each firm in private, without management members of the employer present. The survey instruments that were used in the management and worker interviews are included in the Appendix.

In February-March 2014, approximately ten months after the baseline interviews, the IMPAQ research team, in close collaboration with ILO staff, conducted follow-up in-person interviews with management and workers at seven participating firms. Unfortunately, one firm (Tjokro Bersaudara Komponenindo) withdrew from the demonstration prior to the follow-up interviews and thus did not participate in the survey. In the follow-up survey, we followed the same procedures as in the baseline survey round. Specifically, we used the same survey instruments and attempted to interview the same three managers and the same three workers at each firm. When the same respondents were not available, we recruited other respondents. Worker interviews were conducted in private, without management members of the employer present.

In the remainder of this report we present findings from the employer and worker interviews. We also present results from reports submitted by SCORE training specialists who provided and continue to provide consulting and training services on working time arrangements at the seven firms. The findings also reflect information collected during visits by IMPAQ researchers to the participating firms.

2.2 Background and Objective

The aim of the Working Time Demonstration is to develop a better understanding regarding how working time arrangements can be structured to effectively balance workers’ needs with business requirements, in order to simultaneously improve firm performance and workers’ well-being, particularly their work-life balance. The idea is to develop and pilot-test “win-win” working time arrangements.
arrangements, which will bring measurable benefits to both enterprises and workers. To test this concept, the pilot project will assess if providing employers with working time support and training brings measurable benefits to both enterprises and workers.

Working time arrangements have been studied over the years by many researchers in a variety of countries and settings. Researchers have found that, if properly structured, working time arrangements can be designed to be mutually advantageous for workers and enterprises. For example, some working time arrangements can increase workers’ job satisfaction and improve their work-life balance and, at the same time, decrease absenteeism and reduce employee turnover. Working time adjustments such as increased rest time can reduce worker fatigue and thus reduce accidents increase quality of products. These and other positive results for workers and employers can, in turn, improve productivity, quality and ultimately, the firm’s performance and profitability.

The objective of this research project was to develop a demonstration or pilot to assess the effects of developing and implementing new work schedules/working time arrangements on business outcomes and worker outcomes. This assessment is expected to provide researchers and policy makers with a better understanding of whether and how working time training and support can help small and medium enterprises effectively balance workers’ needs with business requirements.

To achieve the objective of the research project, the ILO designed the Working Time Demonstration in Indonesia. The structure of the demonstration is depicted in Exhibit 1. Initially, eight firms volunteered to participate in the Working Time Demonstration; however, one firm decided to drop out of the demonstration during the implementation period. As a result, only seven enterprises received the full range of demonstration services. In the remainder of this report, we include only the seven firms that participated throughout the demonstration.

As indicated in the exhibit, the first demonstration activity (in February 2013) was a 2-day workshop presented by the ILO and attended by worker and management representatives of the participating firms. Following the workshop, IMPAQ in conjunction with the ILO developed and tested a baseline survey which was administered in April – May 2013. The baseline survey collected baseline information from managers and workers at the participating firms.

Two experienced SCORE consultants provided consulting services to the participating firms. The consultants visited the firms six times over the demonstration implementation period. During these visits, the consultants met with each firm’s Enterprise Improvement Team or EIT

---

and helped to plan working time adjustments, review progress since the last visit, and collect monitoring and evaluation data.

Approximately one year after the initial demonstration workshop, IMPAQ collected followup data from managers and workers at the participating firms. The follow-up questionnaire was the same questionnaire used at baseline. The use of the same questionnaire allows researchers to compare manager and worker responses before and after the demonstration services.

Exhibit 1: Working Time Demonstration in SMEs in Indonesia
2.3  Key Research Questions

Inasmuch as the present study includes only seven firms, the findings from this assessment may not be generalizable to other SMEs internationally or even to other SMEs in Indonesia. Nonetheless, we can learn a great deal from this limited pilot project. Specifically, we can gain a better understanding of whether working time training and consulting services delivered by experienced, professional experts and consultants can lead to adjustments in working time arrangements at the firms. In the remainder of this report, we investigate the following research questions:

- What (if any) are the effects of alternative working time arrangements on firm performance?
  - What are the effects on factors such as labour productivity, product quality, workplace safety (e.g., industrial accidents), absenteeism, and employee turnover?
- What (if any) are the effects of alternative working time arrangements on workers’ well-being, including their work-life balance?
  - What are the effects on workers’ health and well-being, workers’ job satisfaction, and workers’ reported work-life conflict and their satisfaction with their work-life balance?

2.4  Data Sources

To investigate the key research questions we used a variety of data sources:

- Survey Data
- SCORE Consultant Data
- Site Visit Data

Each of these data sources is described below.

2.4.1  Survey Data

We interviewed managers and workers at participating enterprises using survey instruments that were reviewed and approved by ILO (see Appendix for the English versions of the employer and worker surveys). The manager and worker surveys were translated into Bahasa Indonesia and tested prior to implementation. IMPAQ’s local representative in Jakarta was accompanied by an ILO representative at the survey administration.

The baseline interviews (Round 1) were conducted during April - May 2013 (prior to the consultants’ training); the follow-up interviews were conducted during February – March 2014 (after the consultants’ training). Each interview took approximately 30 minutes to complete. As
indicated in Exhibit 2, Round 1 and Round 2 interviews were conducted in seven firms - three firms in the auto/auto parts industry and one each in the following industries: health equipment, garments, printing, and industrial metal working.

In Round 1 a total of 20 managers and 21 workers were interviewed; in Round 2, 19 managers and 22 workers were interviewed. In both survey rounds, we attempted to interview three managers and three workers in each firm; however, when necessary, we made adjustments based on the availability of managers and workers to complete the survey. We also attempted to interview the same respondent in both survey rounds; however, when the same respondent was not available, we substituted other respondents.

As indicated in Exhibit 2, there are 39 manager surveys in Rounds 1 and 2 (20 in Round 1 and 19 in Round 2). Twelve of these respondents were interviewed in both Round 1 and 2 (see Exhibit 3). Eight respondents were interviewed only in Round 1 and seven in Round 2. In some of the analysis in this report, we compare all respondents in Rounds 1 and 2 (i.e., 20 vs. 19); in other analysis, we only compare respondents who completed interviews in both rounds (i.e., 12 vs. 12).
Exhibit 3 presents a similar analysis of the 43 worker respondents (21 in Round 1 and 22 in Round 2). As indicated in the Exhibit, 8 workers responded in both rounds, 13 workers responded in Round 1 only and 14 workers responded in Round 2 only.

Exhibit 3: Manager Surveys

Exhibit 4: Worker Surveys

2.4.2 SCORE Consultant Data

To assess the Working Time Demonstration we were also provided the data collected by the SCORE consultants who provided the training and consulting services for the participating firms.
Specifically, we obtained the performance indicators collected through the SCORE Programme Monitoring and Evaluation (M&E) data system known as the Key Performance Indicators (KPIs). A template of the ILO SCORE KPI form (also known as the Enterprise Indicator Card) is presented in Exhibit 5. The KPI form is used by the consultants to collect monthly indicators over a 12 month period.

In addition to completing the KPI forms, the consultants also collected information describing each consulting visit to the firm. These reports that described: (a) the composition of the worker-management committee (i.e., the Enterprise Improvement Team or EIT), (b) the status of the EIT discussions, and (c) changes that are under consideration for adoption. While the counselor reports were mostly presented in narrative form, the reports follow a consistent template which enables us to evaluate the content and results of the visits to the firms.

2.4.3 Site Visit

In addition to the regular consultants’ site visits, the IMPAQ project director visited participating firms in October 2013. These site visits were conducted together with the SCORE consultants. During the visits, the IMPAQ project director observed firm operations, collected information on changes in working time, and discussed the implementation of the Working Time Demonstration with managers. Some managers explained that they changed their firm’s working time arrangements as a result of the demonstration. Where changes in working time had not yet been implemented, managers described their plans for future adjustments in working time and other planned work changes.

2.5 Assessment Design

Given the relatively small sample size of the Working Time Demonstration (seven firms participated throughout the demonstration); we selected a pre-post design (i.e., a before-and-after comparison) for the assessment. We considered more rigorous assessment designs. For example, we considered an experimental design where enterprises are randomly assigned to treatment and control groups. This rigorous approach was not appropriate for the analysis primarily because the small number of firms in the demonstration precludes obtaining meaningful results from an experimental design demonstration. Next, we considered a quasi-experimental approach where firms participating in the demonstration could represent the treatment group; a matched sample of non-participating enterprises could represent the counterfactual. However, to implement a quasi-experimental design, researchers typically need a large sample of comparison firms for the matching process. Inasmuch as such a large sample of comparison firms was not available, there was no opportunity to employ a quasi-experimental evaluation approach. As a result, we concluded that the most appropriate evaluation design to assess the working time demonstration was a pre-post design of participating firms.

For the quantitative assessment, we collected survey data from the owners and managers of participating enterprises; we also surveyed workers in the participating enterprises. In addition to collecting survey data, we reviewed the information collected by the SCORE consultants through the SCORE Programme Monitoring and Evaluation (M&E) database—that is, the Key Performance Indicators (KPIs) tracked when enterprises are taking part in SCORE training as well as descriptive information about the implementation of working time changes.

The baseline surveys of employers and workers were collected in April - May 2013. These data were used to measure the conditions and outcomes in participating enterprises prior to the implementation of the new working time arrangements. A follow-up data collection was conducted approximately ten months after the completion of the baseline data collection (in February-March 2014).

While ten months may not be sufficient to observe measurable benefits from new working time arrangements, our expectation was that some enterprises would make progress in designing and implementing new working time arrangements. Specifically, we did not expect to observe changes in financial outcomes of participating firms (e.g., revenues, profitability, or productivity); nonetheless, we did expect to observe some new working time arrangements. We also expected to be able to observe changes in managers’ and workers’ attitudes about working arrangements and how it can affect job satisfaction and work-life balance.

Since we do not expect to be able to observe significant changes in quantitative outcomes during the relatively short demonstration implementation period, it is important that our assessment
include a detailed process analysis. A process analysis is needed to enrich the quantitative assessment and to address such questions as:

a) How do enterprise managers respond to consultants’ information on working time?
b) Were some working time changes considered by the managers?
c) Were some working time changes implemented and how?
d) If working time changes were not implemented, why not?
e) What barriers were faced by managers in implementing working time changes?
f) What resources do SMEs require to be able to implement working time changes?

A comprehensive process analysis can address these and other questions. In addition, a process analysis can provide the context for interpreting quantitative results and provide insights that may not be captured in the qualitative analysis. In the following chapter, we present our process analysis and the insights that we gained about the design and implementation of the Working Time Demonstration.

Following the process analysis chapter, we present our quantitative results. The results are presented through a series of exhibits showing outcomes at baseline and at approximately ten months after the baseline surveys. We also present the changes in outcomes between these two time periods. We should note, however, that since we do not have a counterfactual (i.e., data from comparison firms that did not receive consulting services), we are not able to attribute the observed changes to the Working Time Demonstration. Nonetheless, in the following sections of this report, we examine key outcomes, including:

- hourly labour productivity (output per person-hour worked);
- average monthly defect rate;
- absenteeism;
- average monthly wage;
- number of accidents per month;
- employee attrition/turnover rate; and
- workers’ reported job satisfaction, work-life conflict, and satisfaction with work-life balance.
3. PROCESS ANALYSIS

In this section we describe the results of the process analysis conducted as part of the evaluation of the Working Time Demonstration. Specifically, we describe the results of site visits and observations made by the research team, ILO representatives, and SCORE consultants. In the following sections we first describe the seven firms that participated throughout the demonstration followed by a description of the consulting services provided by the SCORE consultants, and the firms’ experience with developing and implementing working time adjustments.

3.1 Participating Firms

As described previously, the seven firms that participated in the Working Time Demonstration were in a variety of industries. Specifically,

- four firms are in automotive parts and accessories manufacturing sectors;
- one firm produced hospital equipment;
- one firm manufactured garments (mostly hospital apparel); and
- one firm provided printing services.

The seven firms also varied widely in the number of employees (between approximately 50 and 150 employees) and in annual revenue (between approximately 20 and 85 billion Rp). There was also a wide variation in the gender of the workers in the participating firms. Most firms had very few female workers; one firm (garment factory), however, employed a substantial majority of female workers.

3.2 Consulting Services

Throughout the demonstration, SCORE consultants provided consulting services to each of the participating firms. A review of the documentation maintained by the consultants indicates that the consultant visited the firms approximately monthly (April, May, June, July, September, and November). Each of the six consultant visits focused on a different activity:

---

5 Jon C. Messenger and Naj Ghosheh.
6 Insanto W. and Abdullah Santoso Rahardjo.
7 One enterprise dropped out early in the demonstration partly due to poor support from management and a lack of authority to adopt new working time arrangements without higher-level approval.
- Visit 1 – (a) establish EIT team, (b) analyze business, (c) discuss working time adjustment options
- Visit 2 – (a) discuss working time adjustment options, (b) review alternative options
- Visit 3 – (a) review problems with implementation,
- Visit 4 – (a) prepare implementation policy
- Visit 5 – (a) assess implementation progress
- Visit 6 – (a) assess implementation progress

While the consultants attempted to maintain a consistent agenda across firms, they were often required to make adjustments in the agenda to accommodate changing firm conditions and changes in composition of the firm management and EIT membership. Changes in EIT membership often affected the timing of working time arrangements that were previously developed and planned. In some cases, changes in EIT membership required consultants to review and repeat the consulting information previously presented.

3.3 Working Time Adjustments

In this section, we review some of the working time adjustments that were planned, attempted, and implemented during the demonstration. Some of the planned working time adjustments had not yet been implemented at the end of the pilot demonstration. A few managers indicated that they planned to implement the changes in the near future. Thus, the demonstration consulting services may have an impact on the participating SMEs in the future.

Based on discussions with the management representatives of several of the participating automotive parts and accessories firms, there were significant obstacles to implementing new working time arrangements. These pressures arose largely from pressures to compete with rival suppliers and pressures to meet customer requirements for quick turn-around of deliverables. For example, automotive parts suppliers claimed that large auto manufacturers (e.g., Toyota) often provided little advance notice and required large quantities of auto parts on very short notice. As a result, workers in these firms were frequently required to work overtime. As a result of significant fluctuation in demand and short notice by customers, it was difficult to make permanent working time adjustments.

Another difficulty in implementing working time adjustments cited by managers at several auto parts manufacturing firms was the lack of human resource (HR) support. That is, firms were unable to identify and hire a sufficient number of skilled workers needed to support significant working time changes (e.g., reduce overtime hours or add a new shift). Managers indicated that without an ability to recruit and hire new skilled workers it was difficult to implement new working time arrangements. Before these firms could implement significant working time
adjustments, they would need to enhance (and in some cases create) an HR department. This assessment of the difficulties in implementing new working time adjustments suggest that an important obstacle to implementing working time adjustments is the lack of HR resources.

Despite these obstacles to making working time adjustments, a number of auto parts firms made an effort to accommodate worker needs and, at the same time, improve productivity. One auto parts enterprise, for example, experimented with adjusting their work schedule. Specifically, for one month this firm adjusted the normal starting time to 7:00 instead of 7:30. Finishing time was adjusted to finish work 30 minutes earlier (16:00 instead of 16.30) and regular overtime time hours were cut in half - from four hours to two hours per day. This temporary adjustment was implemented during the month of July which coincided with Ramadan in 2013. The firm returned to its previous work schedule the following month.

Unfortunately, the firm did not collect sufficient statistics to assess the effect of this temporary change on firm productivity. Workers’ reaction to the change, however, was positive with workers reporting that they felt better rested and had more time for their families when the new work schedule was in operation.

Other auto parts firms also had difficulties making significant working time changes. One firm, for example, made only minor adjustment to its Saturday hours despite an expressed interest in eliminating Saturday hours. Managers at the firm indicated that Saturday hours were necessary since customers expected delivery of parts on Saturday. If the firm could not accommodate Saturday deliveries, it would lose customers to competitors that were eager to fill the gap.

In general, the auto parts manufacturing firms experienced strong demand. Thus, the difficulties that they faced in making new working time arrangements were due to lack of skilled workers, lack of HR support, and lack of infrastructure to measure the effectiveness of working time changes. In contrast, the other here firms in the demonstration experienced a variety of other obstacles in making working time adjustments.

The hospital equipment manufacturer (e.g., incubators and medical furniture) was experiencing growth as a result of the expansion of health care in Indonesia. However, the small physical size and the location of the facility (i.e., in a residential area) were constraining prospects for further revenue growth. To help improve the situation through new working time arrangements, management together with the worker Enterprise Improvement Team (EIT) suggested the implementation of a compressed working week (CWW) with two teams working four days per week on a rotating basis. While management indicated that this new work schedule was expected to be implemented in the near future, it is unlikely to be implemented. First, the plan has not been tested and appears to be too complicated. Particularly since the firm is planning to move its operations to a non-residential area. Given, the significant disruptions likely to be
caused by moving manufacturing operations, we believe that it is unlikely that the firm will make any significant working time arrangements in the near future.

In the printing firm, both management and the EIT were eager to implement new working time arrangements. However, this firm is experiencing a significant lack of product demand which has made changes in working schedules difficult to implement. Nonetheless, the firm did make a small change in working hours: starting time was shifted to 7:30 from 8:00 with a commensurate 30 minute shift in the ending time. In addition, plans are also in place for an additional 30 minute break on Friday to accommodate Muslim prayer time. As in other firms, there is little infrastructure to measure the effects of these or other working time changes.

Finally, the garment manufacturer operates slightly differently than the other firms. That is, workers in this firm are paid a piece rate instead of an hourly wage. As a result, workers at this firm are eager to produce as many pieces as possible during their work hours. This desire to produce as many pieces as possible hours leads to accidents and poor quality. To reduce the incidence of accidents and improve product quality, management decided to adjust their hours and payment structure.

Initially, the company’s working hours were 8.00-12:00 and 13:00-17:00, followed by overtime (if necessary) from 17:00-19:00; between the morning and afternoon working hours, there was a 1-hour lunch break (12:00-13:00). Following discussions with the EIT and business counselors, hours were changed to 7:30-12:00 and 13:00-17:30 with no extra working hours; between the morning and afternoon working hours, there was a 1-hour lunch break (12:00-13:00). In addition to these changes, Saturday hours were reduced by 2½ hours. To encourage adoption of the new working time arrangement, attendance bonuses and a bonus for consistency in showing up to work on time were included as part of the new working time package.

However, after a brief experimentation, widespread tardiness among the workforce forced a return to the workers’ preferred starting time of 8:00. The reduction in Saturday hours was retained since workers liked the reduced Saturday hours. Another important change that was implemented was the complete shut-down of the shop floor during lunch hour. That is, management shut all power off during lunch hour to force workers not to work during lunch. There is some indication that this change reduced product defects and workplace injuries. While the results of this change are not documented accurately, there is an indication that fewer product defects and accidents represent productivity improvements.
3.4 Conclusion

The results of the process analysis lead to a number of observations and conclusions. It should be recognized, however, that these conclusions are based on a small sample of SMEs. As a result, we must treat these conclusions with caution.

Each of the participating firms faced a different business environment and different obstacles to implementing working time adjustments. Nonetheless, there are some lessons to be learned from the experiences of these firms. For example, we observed that management at these firms developed new and enhanced awareness of working time adjustments and the potential for changes in working time to improve productivity and workers’ work-life balance. We also observed increased workers’ awareness of the potential of working time adjustment for improving job satisfaction and work-life balance. This increased awareness of the potential of working time adjustments appear to be a direct result of demonstration and the promotion of management-worker dialogue initiated as a result of the demonstration.

Another observation from the process analysis is that the participating firms lacked the resources and infrastructure needed to effectively implement new working time adjustments. In particular, most participating firms did not have the capacity to support significant changes in working time arrangements. That is, to effectively implement working time adjustments, firms need an effective HR department as well as resources and skills to measure the changes in productivity. Without an HR department that can support recruiting and hiring, firms cannot make significant changes in working time (e.g., reduce overtime hours, add shifts, etc.). Similarly, without the resources and skills needed to measure changes in productivity, management will not recognize improvements in productivity that are brought about by working time changes.

Thus, based on this process analysis, we can conclude that the participating firms did not have the infrastructure necessary to make significant working time adjustments. These firms, however, were able to make more modest changes in working time, including changes in starting and ending time and providing workers with breaks during the workday. Such modest working time changes do not require the firms to make significant investments in infrastructure or hire new workers. Nonetheless, the benefits of these modest changes can easily be measured. For example, management can easily measure reductions in accidents, reduced product defects, and improved product quality. Furthermore, these modest changes can have a substantial positive impact on workers’ job satisfaction and work-life balance.
4. EMPLOYER SURVEY RESULTS

In this chapter, we describe the employer survey results. The employer survey was conducted in seven firms located in Jakarta, Indonesia. We interviewed 2-4 management respondents in each firm. For most questions (e.g., how long has the firm been in business), we use the response provided by the majority of the respondents in the firm. For example, if 2 managers answered that the firm was 15 years old but one answered 16 years, we used 15 years as the response. For other questions (e.g., how long have you worked at this firm), we used each respondent’s answer.

In presenting descriptive statistics, we generally use the information that was collected during the baseline surveys. For example, in presenting firm age, number of employees, etc. we use the data collected at the time of the baseline surveys.

In the remainder of this chapter, we present the results from the employer survey. For ease of reference, in most exhibits, we identify the question number and the question from the survey as part of the exhibit (the employer survey is included in Appendix A). Below, we first present some descriptive statistics of the participating firms. Next, we present some changes that were reported by managers during the demonstration period (i.e., changes between the baseline and follow-up surveys). Finally, we present managers’ attitudes about working time in their enterprise.

4.1 Description of Participating Firms

Seven small and medium-sized enterprises participated in the Working Time Demonstration for the duration of the demonstration. As indicated above, these firms were distributed across a variety of industries (see Exhibit 6). Moreover, all seven firms are generally well established with an average age of 22.1 years in business. As indicated in the exhibit three of the firms are in the auto/auto parts industry; there are also participating firms in printing, garments, industrial metal working, and health care equipment. Two of the enterprises were in business for fewer than 20 years at baseline, while the remaining five firms were in business for more than 20 years.

AVERAGE AGE 22.1

A5. How many years has [COMPANY] been in business?

The gender distribution of workers in the seven participating firms is highly skewed. As seen in Exhibit 7, females represented less than five percent of the workforce in five firms. One firm (health equipment) had 10% - 19% female workers while the garment firm had a majority of female workers (50% - 75%). As a result of this skewed gender distribution of workers, we do not analyze the results by gender since such an analysis would be dominated by firm differences rather than gender differences.

Exhibit 7: Percent Female Employees

- 5 firms: <5% gender distribution
- 1 firm: 5% - 9% gender distribution
- 1 firm: 10% - 19% gender distribution
- 1 firm: 50% - 75% gender distribution
- 1 firm: >75% gender distribution
In addition to a variation in industry, age, and gender there is also a wide variation in the size of the seven participating firms (see Exhibit 8). The number of employees in these firms ranged from 50 to 150 workers with an average of 87 workers per enterprise.

**Exhibit 8: Number of Employees at Baseline**

![Exhibit 8: Number of Employees at Baseline](image)

Just as the firms varied by number of employees, at baseline, the firms also exhibited a broad range of starting wages for new entry-level employees. As seen in Exhibit 9, in two firms, the starting wage for an entry level employee was 1.3 million Rupiah (Rp) per month. In contrast, one firm paid 2.2 million Rp. The average entry-level wage at baseline was approximately 1.7 million Rp.

**Exhibit 9: Starting Wages at Baseline**

(Million Rp per month)

![Exhibit 9: Starting Wages at Baseline](image)
All companies reported that entry-level salaries are the same for male and female employees with equivalent skills. All companies also reported that the number of hours worked is the same for male and female employees in similar positions.

4.2 Changes from Baseline

In the follow-up survey, we noted a number of changes from the values that were reported by managers in the baseline surveys. While it is not possible to attribute the observed changes to the Working Time Demonstration, some of the observed changes may shed some light on the potential impact of similar training and consulting programs on participating enterprises in developing countries. Below, we describe some of the changes that were observed between the baseline and follow-up surveys.

Before proceeding to describe the observed change in starting wages, we must note that there was a dramatic legal change in minimum wage during the period of the demonstration. Such an exogenous change during the demonstration makes it difficult to assess the effect of the Working Time Demonstration on starting wages. That is, the legal change in Indonesia’s minimum wage most likely dominated any impact that the demonstration may have had on the wages of workers in the participating enterprises.

In Indonesia, the legislative standard for minimum wages is specified in Articles 88, 89 and 90 of Act 13 of Indonesia’s Labor Law (2003). This law allows for the local governments to set the minimum wage levels for their jurisdiction. Thus, there is no nationwide minimum wage standard; rather, minimum wage is set annually by each province’s governor (or each district/city’s mayor). In addition, a minimum wage standard is established by sector or occupation within the province.

In November 2013, Jakarta’s Governor announced a new minimum wage for 2014. This new minimum was set at Rp 2.4 million ($213) per month which represents a 10 percent increase from 2013’s minimum wage, which was set at Rp 2.2 million. Once a new minimum wage is established, companies are obliged to adhere to the new minimum wage.

Exhibit 10 presents the starting wage reported by managers in the follow-up survey. As indicated, the starting wage at follow-up was 2.1 million Rp, a significant increase from the baseline starting wage level of 1.7 million Rp. It is interesting to note that the increase in starting wage was not uniform across the participating firms. As seen in Exhibit 11, starting wage increased in 6 of the 7 firms. In one firm (the printing firm), the starting wage declined from 2.2 to 2.0 million Rp. This firm reported difficulty in marketing their products and achieving desired

---

revenue goals. The remaining 6 firms reported an average increase in starting wage of 40 percent.

Exhibit 10: Starting Wage at Follow-up
(Million Rp per month)

Exhibit 11: Starting Wage at Baseline and Follow-up
(Million Rp per month)

Based on managers’ survey responses, approximately half of the firms reported some difficulty in recruiting suitably skilled workers, while the rest reported no such difficulties. Based on discussions with the managers, it appears that recruiting was mainly a problem in growing firms
and firms that required trained workers. Firms that had stable or declining revenues did not appear to have recruiting issues.

The number of work days in a typical week did not change during the demonstration period. Two firms indicated that typically they work 5 days a week; five firms responded that a typical work week is 6 days (see Exhibit 12).

Hours of work however did change during the demonstration. In Indonesia, minimum wage is calculated based on a 40-hours work week which can be either: (a) 7 hours a day and 40 hours a week for 6 workdays a week, or (b) 8 hours a day and 40 hours a week for 5 workdays a week.9 Beyond 40 hours per week, employers must pay overtime. As indicated in Exhibit 13, at baseline 3 of the 7 firms indicated that a typical work week was 40-44 hours; the remaining firms indicated that typically their work week was 45-50 hours. At follow-up, however, work hours shifted among these firms. One firm reported that the typical work week was more than 50 hours; two firms reported work weeks of 45-50 hours; and four firms reported typical work weeks of 40-44 hours.

9 Act No 13/2003 article 77 regulates weekly work hours for minimum wage.
These results suggest that workers’ hours in some of the demonstration firms declined during the period of observation while workers’ hours in another firm increased. That is, whereas, at baseline, no firm reported more than 10 hours of overtime per week, at the time of the follow-up, one firm reported more than 50 total working hours per week.

On the basis of the employer’s survey, it is unclear whether changes in weekly work hours increase or decrease workers’ satisfaction. As indicated in Exhibit 14, managers indicated that, at follow-up, workers were generally satisfied with their work hours. Specifically, managers in 100% of the firms responded that they believed that their workers were generally satisfied with their firms’ weekly hours of work. In contrast, at baseline, managers in one firm reported that workers were not generally satisfied with their work hours.

**Exhibit 14: Managers’ Perceptions of Employees’ Satisfaction with Working Hours**

In response to a question about workers’ ability to get time off to take care of family issues, all seven employers answered ‘yes’ (Exhibit 15). In contrast, only two employers indicated that workers can adjust their schedule in order to take care of family issues, the other five employers responded ‘no’ (see Exhibit 16). Again, no change between the baseline and the final surveys.

Just as there is a wide range in the number of employees across the seven participating firms, there is also a broad range in the level of revenues for the participating firms (see Exhibit 17). As indicated, some of the firms experienced an increase in revenue during the observation period while others experienced a decline (data is missing where the respondents answered “don’t know”). As indicated in the exhibit, the average revenue for the participating firms is 37 billion Rp. The smallest firm had revenue of 20 billion Rp in 2012; the largest firm had 85 billion Rp in revenue. As indicated in the exhibit, revenue increased in some firms and decreased in others.

Exhibit 17: Revenue
(Rp billion)

C1. What was [COMPANY]'s total sales/revenue in 2012?

All participating firms indicated that they measure the quality of the firm’s output as well as productivity. Interestingly, however, at baseline all managers responded that their firm’s productivity had increased in 2012 (before the demonstration). In the follow-up period, however, two firms indicated that their productivity did not increase in 2013 (during the
One interpretation of this result is that the managers at participating firms were now using more sophisticated approaches to measuring firm productivity and, as a result, they were able to respond more accurately.

A review of managers’ response to an open-ended question about measuring productivity (C6. How does the COMPANY measure productivity?) indicated that some of the firms were using detailed procedures to measure productivity. Since the SCORE consultants emphasized measurement of productivity in their consulting services we believe that managers now pay more attention to measuring productivity.

Another area where we observed an interesting change between baseline and follow-up is in the number of accidents recorded in the participating enterprises during the prior year. As indicated in Exhibit 18, at baseline six enterprises reported 1-5 worker accidents in the prior year. At the time of the follow-up, only two firms reported 1-5 worker accidents in the prior year; the remaining five enterprises reported no accidents in the prior year. Thus, it appears that the consultant services may have influenced enterprise awareness about worker safety.

### 4.3 Managers’ Attitudes about Working Time

As described in Exhibit 2, we interviewed 20 managers in the baseline survey and 19 managers in the follow-up survey for a total of 39 respondents in the two surveys. More than half of the 39 manager respondents (24) responded to both surveys. The remaining respondents responded to either the baseline or the follow-up survey. To assess the attitudes and changes in attitudes among the manager respondents, we can either examine the 12 managers who responded to both surveys or we could examine the attitudes of all managers in the sample. A review of the data indicates that the results appear quite similar whether we assess all respondents or only the respondents who responded to both surveys. Below, we present the results for both groups: (a) all respondents (39) and (b) repeat respondents (24). Where the results are substantially different for the two samples, we discuss both results; otherwise, we focus on all respondents.

In the surveys, we asked about managers attitudes on the impact of working time on a variety of worker outcomes. Specifically, we asked the following question:
E1. Some people think that changes to working hours or work patterns can have an effect on the firm or its employees. I am going to read you a number of statements. Thinking of your company, please tell me how strongly you agree or disagree with each statement. Tell me if you (a) Strongly Agree, (b) Agree, (c) Neither agree nor Disagree, (d) Disagree, or (e) Strongly Disagree.

We then asked managers to assess the effect of working time on the following outcomes:

a. Improved worker satisfaction
b. Improved worker productivity
c. Reduced quit rates of workers
d. Reduced the cost of hiring/re-hiring
e. Improved profitability
f. Reduced the number of accidents
g. Reduced the number of stoppages
h. Reduced defect rates
i. Improved quality of production
j. Improved family relationships
k. Improved well-being of workers
l. Other (please specify): __________

In the graphs below, we present the percentage of respondents who responded positively (either a. Strongly Agree or b. Agree). For example, in Exhibit 19, at baseline, 59% of all respondents responded positively to **E1a. Improved Worker Satisfaction**; the remaining 41% (not shown) gave a neutral or negative response to this question: c. Neither agree nor Disagree, d. Disagree, or e. Strongly Disagree. At follow-up, managers’ attitudes were more positive regarding the effect of changes in working time arrangements on improved workers’ satisfaction (74%). Thus, it appears that participation in the demonstration changed managers’ attitudes positively toward working time changes.
Exhibit 19: Improved Worker Satisfaction

The change in managers’ attitudes appears similar with regard to improvement in worker productivity. As indicated in Exhibit 20, there was a small increase between baseline and follow-up in managers' positive attitude with regard to E1b. Improved Worker Productivity. Managers were more positive at follow-up in their attitude about the impact of changes in working time arrangements on improving worker productivity. As in the previous exhibit, the change from baseline to follow-up is slightly more positive for repeat managers (i.e., managers who responded to both surveys).

Exhibit 20: Improved Worker Productivity
While managers’ attitudes on nearly all outcomes appear to change positively, there were a small number of outcomes that were hardly affected. For example, among all respondents, there was a minimal (slightly negative) change in managers’ attitude that working time changes improved profitability (see Exhibit 21). In contrast, among repeat respondents the change in attitude was more positive.

**Exhibit 21: Improved Profitability**

![Bar chart showing improved profitability over baseline and follow-up among all respondents and repeat respondents.](image)

Similarly, among all respondents, there was a slightly positive change in managers’ attitudes that working time changes reduced the number of accidents (see Exhibit 22). In contrast, among repeat respondents the change in attitudes was more positive.

**Exhibit 22: Reduced Number of Accidents**

![Bar chart showing reduced number of accidents over baseline and follow-up among all respondents and repeat respondents.](image)
In a second series of question (E3), we asked managers how workers feel about their working conditions at the firm. Specifically, we asked the following:

E3  *I am going to read a list of aspects of your company’s working conditions. Please tell me how the workers in your company feel about each aspect. Tell me if you think they: (a) Strongly Like, (b) Like, (c) Neither Like Nor Dislike, (d) Dislike, or (e) Strongly Dislike.*

We then asked managers to assess how workers feel about the following aspects of the company’s working conditions:

a. Daily work hours  
b. Weekly work hours  
c. Overtime hours  
d. Flexibility in working hours  
e. Salary  
f. Health and safety conditions  
g. Job satisfaction  
h. Work-life balance  
i. Opportunity for promotion  
j. Other (please specify): ___________

We then grouped the positive responses (a. *Strongly Like* and b. *Like*) and present the results in the graphs below. As indicated in Exhibit 23, managers indicated that workers in their firm generally feel positively toward their daily working hours. Moreover, managers’ belief grew more positive at follow-up as compared with the baseline period. Again, the increase for repeat respondents was greater than for all respondents.

**Exhibit 23: Daily Work Hours**
Managers’ responses regarding overtime hours were similar. As indicated in Exhibit 24, managers indicated that workers were generally satisfied with their overtime hours at baseline; managers’ perceptions of workers’ satisfaction levels increased somewhat at follow-up. Again the increase was somewhat higher for the repeat respondents.

Exhibit 24: Overtime Hours

The results of managers’ views regarding workers’ feelings about the work-life balance at the firm are presented in Exhibit 25. These results are nearly identical to the results on feelings about overtime hours. That is, managers believed that workers were generally satisfied with the work-life balance at baseline and their perceptions of workers’ satisfaction levels increased somewhat at follow-up.

Exhibit 25: Work-Life Balance
The results of the employer surveys generally indicate that managers believe that changes in working time arrangements can have a positive effect on important firm outcomes. Furthermore, managers generally believe that workers feel positively toward their working conditions. Interestingly, when comparing managers’ survey responses at baseline with the responses at follow-up, managers were uniformly more positive at the follow-up survey. This conclusion indicates promise for programs like the Working Time Demonstration since, it appears that managers have ‘bought into’ the ideas and concepts about changes in working time arrangements that were presented by the consultants.

Employers’ acceptance and adoption of the potential benefits of working time adjustments is critical to the overall success of a program such as the Working Time Demonstration. This conclusion was eloquently expressed in a recent study:\(^\text{10}\)

“Regardless of how well-designed a company’s approach to workplace flexibility is, if managers aren’t on board and don’t have the skills and attitudes to manage effectively, it will flounder. It’s as simple as that. This study is proof positive that it is possible to properly equip managers, even those who might be resistant, to succeed in leading a flexible team.”

\(^\text{10}\)http://nebula.wsimg.com/530151b29ea17477413883c70f65ab80?AccessKeyId=C35ABFD395C6B39BAA6C&disposition=0&alloworigin=1
5. WORKER SURVEY RESULTS

In addition to interviewing employers at baseline and at follow-up, we interviewed employees at the participating firms as well. In this chapter, we describe the results of the Worker Survey. As presented in Exhibit 2, we interviewed 22 workers at baseline and 22 at follow-up for a total of 44 worker respondents. Half of the 44 worker respondents (22) responded to both the baseline and follow-up surveys; the remaining 22 respondents responded to either the baseline or the follow-up survey only. In the analysis below, we generally use the full sample of 44 respondents. In some cases, for example, to assess attitude changes among respondents, we present results for the following groups separately: (a) all respondents (44) and (b) repeat respondents (22).

As in the previous chapter, for ease of reference, in each exhibit we identify the question number and text from the survey (the full worker survey is included in Appendix B). In the remainder of this chapter, we first present descriptive statistics of the workers in the sample; next, we present changes that were reported during the demonstration period (i.e., changes between the baseline and follow-up surveys); finally, we present workers’ attitudes about their working time.

5.1 Workers in the Participating Firms

As indicated in Exhibit 26, most of the respondents in the baseline and follow-up surveys were production workers, with very few respondents in other categories.

<table>
<thead>
<tr>

5.2 Changes from Baseline

All workers interviewed reported an increase on salary in both 2012 and 2013. This annual increase in salary is largely due to the increase in the minimum wage decrees that took effect in November 2012 and November 2013. It is interesting to note that all respondents indicated that men and women holding the same position work the same number of hours per week. Furthermore, all respondents indicated that men and women with similar skills receive the same starting salary.

In addition to reporting salary changes, workers in participating firms also reported changes in their work hours. As indicated in Exhibit 28, at baseline, no respondents reported working fewer than 8 hours in a typical day; at follow-up, 27 percent reported fewer than 8 hours of work in a typical day. The only response category that increased from baseline to follow-up was working 10 hours on a typical day (an increase from 5 to 9 percent). On average, the typical work day fell from 8.3 to 8.0 hours.

Exhibit 28: Hours per Day

B2 In a typical DAY, how many hours do you work?
The questionnaire also addressed overtime hours worked in a typical week. All workers indicated that overtime hours were required and were not voluntary. Only two respondents indicated that they can choose the number of overtime hours they would like to work; others responded that they had no choice in number of overtime hours. As indicated in Exhibit 29, nearly all workers indicated that they worked some overtime hours in a typical week. The exhibit also indicates that some workers experienced a decline in overtime hours while others experienced an increase. For example, the proportion of workers who reported working 10-14 hours of overtime in a typical week nearly doubled from 14% at baseline to 27% at follow-up. Nonetheless, overall there was a decrease in average overtime hours from 7.9 hours per week to 7.0 hours per week.

**Exhibit 29: Overtime Hours per Week**

An examination of the normal work starting time at baseline and at follow-up indicated that half of the enterprises typically start the work day at 7:00-7:59 AM; the other half start the work day at 8:00-8:59AM. The distribution of ending times, however, was more varied across the participating firms. As seen in Exhibit 30, at baseline, 10 percent of workers ended their work day before 4:00 PM; at follow-up, however, no workers ended the work day before 4:00 PM. Moreover, at follow-up, there was an increase in the number of workers who ended the work day at 5:00-5:59PM (from 32 percent to 50 percent).
Only one worker reported dissatisfaction with the starting and ending work times. There was, however, more dissatisfaction with the total hours of work per week. As indicated in Exhibit 31, at baseline, only approximately half of the respondents (52%) were satisfied with their total hours and the other half were dissatisfied. At follow-up, satisfaction with working hours improved and nearly three-quarters (73%) were satisfied and approximately one-quarter (27%) were dissatisfied with their total hours. It should be noted that among those who responded that they were not satisfied with their total hours, some wanted more hours while others wanted fewer hours.

**Exhibit 31: Satisfaction with Total number of Work Hours**

Baseline Follow-up
When we asked managers about absenteeism in their firms, all managers responded that absenteeism does not represent a problem. When we asked the workers about the number of days that they had been absent in the past six months, a substantial number indicated that they had been absent from work during this period. On average at baseline, workers reported that they were absent 2.3 days over the past six months; at follow-up, workers reported 2.0 days absences during the past six months. Apparently, this level of absenteeism does not represent a problem for managers since they indicated that they did not have a problem with absenteeism.

5.3 Workers’ Attitudes about Working Time

In addition to asking workers objective questions about their work, we also asked workers a series of opinion questions about work schedules and other conditions at their work place. For example, we asked:

D1. Some people think that changes to working hours or work schedules can have an effect on the firm or its employees. Thinking of your company, please tell me how strongly you agree or disagree with each statement. Tell me if you (a) Strongly Agree, (b) Agree, (c) Neither agree nor Disagree, (d) Disagree, or (e) Strongly Disagree.

We then asked workers for their views of the impact of changing working hours or work schedules on the following outcomes:

a. Improved worker satisfaction
b. Improved worker productivity
c. Reduced quit rates of workers
d. Reduced cost of hiring/re-hiring
e. Improved profitability
f. Reduced the number of accidents
g. Reduced the number of stoppages
h. Reduced defect rates
i. Improved quality of production
j. Improved family relationships
k. Improved well-being of workers
l. Other (please specify): _________

In the graphs below, we present the percentage of respondents who responded positively (either a. Strongly Agree or b. Agree). We also show results separately for (a) workers who responded to both the baseline and follow-up surveys (i.e., repeat respondents), and (b) all respondents. For example, in Exhibit 32, at baseline, 52% of all respondents responded positively to D1a. Improved Worker Satisfaction; the remaining 48% (not shown) gave a neutral or negative response to this question: c. Neither agree nor Disagree, d. Disagree, or e. Strongly Disagree. At
follow-up, workers’ attitude was more positive; 91% responded that changes in working time arrangements improved workers’ satisfaction. Thus, it appears that participation in the demonstration changed workers’ attitudes positively toward the impact of working time changes on workers’ job satisfaction.

Exhibit 32: Improved Worker Satisfaction

A similar improvement in workers’ views is seen in Exhibit 33 where, at baseline, 58% of all workers’ indicated that they thought that changes in working time arrangements improved workers’ productivity. At follow-up, 82% of all workers indicated that they thought that changes in working time arrangements improved workers’ productivity.
Similar improvements in workers’ views about the effects of changes in working time arrangements were found for most of the other outcomes listed above (e.g., reduced quit rates, improved family relationships, etc.). There were, however, some outcomes where worker views showed little improvement between baseline and follow-up. For example, as indicated in Exhibit 34, among all respondents, approximately two-thirds of the sample at baseline and at follow-up indicated that changes in working time arrangements have a positive effect on quality of production. Thus, the demonstration affected workers’ views about the effect of changes in working time arrangements on some outcomes, the demonstration did not affect workers’ views on other outcomes.
In addition to asking workers about their general views on the effects of changes in working time arrangements, we also asked workers a series of more specific questions about their companies’ working time arrangements:

D2  *I am going to read a list of aspects of your company’s work practices. Please tell me how you feel about each of the following aspects of your company’s work practices. Tell me if you: (a) Strongly Like, (b) Like, (c) Neither Like Nor Dislike, (d) Dislike, or (e) Strongly Dislike.*
We asked workers about the following aspects of their company’s work practices:

a. Daily work hours  
b. Weekly work hours  
c. Overtime hours  
d. Flexibility in working hours  
e. Salary  
f. Health and safety conditions  
g. Job satisfaction  
h. Opportunity for promotion  
i. Other (please specify): ______

We then combined (a) Strongly Like and (b) Like to indicate approval of the company’s practice. As indicated in Exhibit 35, among all respondents, at baseline, half who responded indicated approval of their company’s daily work hours. At follow-up, the proportion of respondents who indicated that they approved of their company’s daily work hours increased to two-thirds (68%).

**Exhibit 35: Daily Work Hours**

![Bar chart showing daily work hours at baseline and follow-up. At baseline, 50% of all respondents and 50% of repeat respondents approved. At follow-up, 68% of all respondents and 75% of repeat respondents approved.](chart.png)
An analysis of other aspects of the company’s practices revealed similar results. For example, Exhibit 36 presents workers’ views about how their company’s practices affect job satisfaction. The results show that at baseline half the respondents indicated approval of their company’s practices; at follow-up, approximately three-quarters of respondents expressed approval.

### Exhibit 36: Job Satisfaction

![Graph showing job satisfaction results](image)

In addition to asking about workers’ opinions about aspects of their companies’ practices, we asked workers their opinions about their companies’ working time arrangements:

D3  *Now, I would like to know about how working time arrangements (work schedules) affect you and your family. For each of the following, please tell me if you: (a) Strongly Agree, (b) Agree, (c) Neither Agree nor Disagree, (d) Disagree, or (e) Strongly Disagree.*

Specifically, we asked workers’ their opinions on whether working time arrangements:

a. Provide sufficient time with family
b. Allow time to deal with family needs
c. Allow time to deal with family emergencies
d. Allow to have a good work-life balance
e. Improve job satisfaction
f. Other (please specify): _________________________
As depicted in Exhibit 37, about two-thirds (68%) of all respondents at baseline strongly agreed or agreed that the company’s working time arrangement provides sufficient time with their families. At follow-up, all respondents strongly agreed or agreed that the company’s working time arrangement provides sufficient time with their families. Workers responded similarly that the company’s working time arrangements allow them sufficient time to deal with: family needs (Exhibit 38) and family emergencies (Exhibit 39).

Exhibit 37: Sufficient time with family

Exhibit 38: Sufficient Time to Deal with Family Needs
Workers’ responses about how working time arrangements affect their work-life balance is presented in Exhibit 40. At baseline, only about one-third (35%) of all respondents said that they strongly agreed or agreed that their company’s working time arrangements allowed them to have a good work-life balance. At follow-up, nearly three-quarters (73%) of the respondents had the same views. This result suggests that the demonstration may have had an impact on workers’ work-life balance.
Finally, we asked workers about their overall opinion about their current job and their work-life balance.

D4  

In summary, for each of the following please tell me if you are (1) Highly Satisfied, (2) Satisfied, (3) Neither Satisfied nor Dissatisfied, (4) Dissatisfied, or (5) Highly Dissatisfied with:

(a) Your current job  
(b) Your work-life balance

As indicated in Exhibit 41, at baseline approximately half of the respondents indicated that they were highly satisfied or satisfied with their current job. The proportion that was satisfied increased to approximately three-quarters (73%) at follow-up.

Exhibit 41: Your Current Job

The results on work-life balance were also positive. Exhibit 42 indicates that only one quarter (24%) of the respondents were highly satisfied or satisfied with their work-life balance at baseline. The proportion who were highly satisfied or satisfied at follow-up, however, increased to 59%. This substantial increase suggests that the demonstration may have had a positive impact on workers’ work-life balance.

6. CONCLUSIONS AND LESSONS LEARNED

Working time is an important issue for the ILO today, as it has been ever since the founding of the organization. The ILO first established limits on daily and weekly working hours in the very first ILO Convention: the Hours of Work (Industry) Convention, 1919 (No. 1). Since this first convention, the ILO has continued to emphasize working time standards, focusing on such issues as hours of work, weekly rest, night work, paid annual leave, and part-time work.

In recent years, working time issues have again risen to prominence at the ILO. In October 2011, the ILO convened a Tripartite Meeting of Experts on Working-time Arrangements to review and advise on modern working-time arrangements. The Meeting unanimously adopted a set of Conclusions that outline a future course of ILO action in the area of working time. Since that time, the focus of the ILO has been on conducting research to better understand the contribution of innovative working time arrangements to organizational performance and workers' work-life balance.

This Report presents an assessment designed to help understand the potential of innovative working time arrangements on organizational performance and workers' work-life balance in small and medium-sized enterprises (SMEs). The Working Time Demonstration in Indonesia was implemented in Jakarta, Indonesia during 2013 in seven small industrial firms that were already participating in an ILO training program.

These seven demonstration firms were participating in ILO’s Sustaining Competitive and Responsible Enterprises program (SCORE) when the Working Time Demonstration began in early 2013. The SCORE program is designed to help SMEs improve their productivity and quality. SCORE provides a modular training program that focuses on developing cooperative relations between managers and workers at the workplace (workplace cooperation). Each of the five modules includes a two-day classroom training for managers and workers and follow-up consultations with experts in the participating enterprises. SCORE currently operates in several developing countries, including Indonesia, under a global ILO programme.

In the Working Time Demonstration, SCORE training was combined with training designed to improve working time arrangements at participating firms. The goal of this pilot project was to enhance firm productivity, along with workers’ job satisfaction, and workers’ work-life balance.
To assess the implementation and effectiveness of the Working Time Demonstration, researchers used the following inputs:

- baseline surveys of managers and workers at seven SMEs in the Greater Jakarta area,
- insights and data provided by consultants during their visits to the seven firms,
- site visits by researchers to observe program operations at the participating firms, and
- follow-up surveys conducted following the completion of demonstration services.

It is important to recognize that the results of this assessment should not be extrapolated to a broader population of enterprises and workers in Indonesia or in other countries. The results of our assessment are limited due to the:

- small number of firms in the demonstration,
- firms volunteered for the demonstration (i.e., they were self-selected), and
- the small sample of workers and managers interviewed.

Nonetheless, we believe that the assessment has important value since it provides important insights on:

- best practices on how to implement working time consulting services,
- measuring the effectiveness of working time consulting services,
- whether working time adjustments can affect firm outcomes such as productivity and profitability, and
- whether working time adjustments enhance workers’ job satisfaction and work-life balance.

### 6.1 Conclusions

Using baseline and follow-up data, together with insights from the SCORE consultants and the site visits to the participating firms, we are able to assess the Working Time Demonstration. Specifically, in this report we compared the outcomes from two surveys (baseline and follow-up) to assess if the demonstration services had an effect on enterprises or workers. The results of our pre-post assessment revealed that employers and workers changed their views on the impact of changing working time arrangements on a variety of outcomes. That is, when comparing survey responses from the baseline to the follow-up period, both workers and managers became more optimistic about the potential effect of changes in working time arrangements on business and worker outcomes.

The similarity between managers’ and workers’ responses to a variety of survey questions is striking. At baseline, for example, both managers and workers felt that changing working time
arrangements can have an effect on workers’ job satisfaction (see Exhibits 19 and 32). At follow-up, a substantially higher percentage of both managers and workers felt that working time changes can have an effect on workers’ job satisfaction. A similar pattern was found for other survey questions; that is, both managers and workers became more optimistic over time about the potential of working time changes to affect outcomes from baseline to follow-up. Thus, it appears that involvement with the Working Time Demonstration influenced the attitudes of both managers and workers regarding working time adjustments and their potential to affect work related outcomes.

A review of the findings presented in this report reveals the following insights and conclusions:

- **Few changes in working time were implemented during the demonstration.** While efforts were made to implement working time adjustments, only small adjustments were successful. Efforts to make dramatic changes in working time did not succeed due to a variety of obstacles (e.g., lack of infrastructure, HR support, etc.).

- **Enterprise revenues and profitability did not change as a result of the demonstration services.** Based on managers’ responses to questions on revenues and profitability, there does not appear to be a consistent change in revenue or profitability. Some firms experienced increases while others experienced decreases in revenues and profitability.

- **The demonstration appears to have reduced the number of accidents at participating enterprises.** At baseline six enterprises reported 1-5 worker accidents in the prior year. At the time of the follow-up, only two firms reported 1-5 worker accidents in the prior year; the remaining five enterprises reported no accidents in the prior year.

- **Both managers and workers believe that working time adjustments can increase productivity.** Both managers and workers believed that working time adjustments can affect productivity. This result is interesting since participating firms did not know how to measure productivity accurately.

- **Managers became increasingly aware of the need to measure productivity.** During the demonstration, managers asked for assistance in measuring productivity. While consultants made efforts to provide this training, enterprises were unable to measure productivity accurately. Specifically, enterprises continued to measure productivity using outputs without considering inputs.

- **At the follow-up survey, workers felt substantially more positive about their job and their work-life balance than they did at baseline.** This finding is somewhat surprising.
inasmuch as there were few changes in working time during the demonstration. One possible explanation of this finding is that workers recognized and appreciated management’s concern about their work-life balance. While significant changes were not implemented, managers were making an effort to consider and experiments with new working-time arrangements. Furthermore, workers' involvement in the process of developing new work schedules may have indicated a level of respect from managers from management that contributed to workers’ feeling more positive about their job and their work-life balance at the follow-up survey.

Based on these results, we cannot reach definitive conclusions about the efficacy of the Working Time Demonstration in producing measureable changes in enterprise and/or worker outcomes. However, this assessment does provide researchers and policymakers with guidance for future, more comprehensive assessment of the impact of changes in working time. The current assessment may thus lead to subsequent larger demonstrations that will provide more rigorous evaluations of the efficacy of working time arrangements on firms’ performance and profitability, as well as on workers’ job satisfaction and work-life balance.

6.2 Lessons Learned

The implementation of the Working Time Demonstration has provided a limited set of insights about working time adjustments in SMEs. The demonstration has also provided lessons on how to implement working time adjustments in SMEs and future demonstrations on working time adjustments. The following are some some lessons from the present demonstration and obstacles that SMEs must overcome in any future working time adjustment demonstration.

- **HR infrastructure limitation.** Most SMEs do not have sufficient resources to implement significant working time adjustments. For example, SMEs may not have sufficient HR resources to support hiring large numbers of new employees needed to introduce a new shift or to eliminate overtime hours. As a result, future demonstrations should consider including support to the enterprise HR department.

- **Other infrastructure limitations.** For managers to recognize the benefits of working time changes, SMEs must be able to measure changes in productivity, product quality, and/or profitability that result from working time changes. Unfortunately, many SMEs do not have the knowledge, capacity, and infrastructure needed to measure these changes. As a result, future demonstrations should consider including support in measuring productivity and product quality.

- **Working time adjustment options.** The present demonstration has shown that SMEs had difficulties in successfully implementing working time adjustments in a short period.
This lack of success may partly be due to the fact that the working time changes that were considered by the enterprises were overly complex and overly ambitious. A more limited set of options for implementation may have let to greater success. Thus, any future demonstration should consider offering training in a limited set of working time adjustment options.

While there are no current plans to implement a new demonstration, planners should consider these lessons in any future effort to promote working time adjustments in SMEs.

Interviewer ___________________  Date ___________________
INTRODUCTION
Hello, my name is (NAME), and I’m from IMPAQ International, a research firm conducting a study to assess the results of the Working Time Initiative for the International Labor Organization (ILO). I would like to ask you some questions about your firm’s working time arrangements.

Your answers will be kept confidential and only reported to the ILO as grouped data.

SECTION A- Employer Characteristics

I’d like to start with some general questions about your company.

A1 Our records show that your company name is [COMPANY]. Is that correct?

YES ........................................................................................................ 01
NO ..................................................................................................... 05 → GO TO A1a

DON’T KNOW .............................................................................. 98 → GO TO A1a
REFUSED ........................................................................................ 97

A1a What is the name of your [COMPANY]?

________________________________________________________________________

A2 What is your name? __________________________________________________

A3 What is your position at [COMPANY]?

Are you:
An owner .............................................................................................. 01
Director ............................................................................................... 02 → GO TO A3a
Manager or supervisor .......................................................................... 03 → GO TO A3a
Other position (specify ________________________________________) ... 04 → GO TO A3a

DON’T KNOW ...................................................................... 98
REFUSED .................................................................................... 97

A3a What Department? Please specify

_______________________________________________________________________

DON’T KNOW ...................................................................... 98
REFUSED .................................................................................... 97
A4. In which industry does [COMPANY] operate?
Would you say it is in:

- PRINTING ................................................................. 01
- GARMENT ................................................................. 02
- AUTO/AUTO PARTS ..................................................... 03
- OTHER Specify ......................................................... 04
- DON’T KNOW .......................................................... 98
- REFUSED ................................................................. 97

A5. How many years has [COMPANY] been in business?

_____ Number of years

- DON’T KNOW .......................................................... 98 → GO TO A5a
- REFUSED ................................................................. 97

A5a. Would you say [COMPANY] has been in business...

- Less than 5 years...................................................... ... 01
- 5-9 years................................................................. ... 02
- 10-19 years ........................................................... 03
- 20-50 years............................................................. 04
- More than 50 years................................................... 05
- DON’T KNOW .......................................................... 98
- REFUSED ................................................................. 97
Now I am going to ask you some questions about the number of workers in this company. If you don’t know the exact answer, please provide your best estimate.

A6. How many total people work in this company?

____ Number of employees

DON’T KNOW ................................................................. 98 \rightarrow A6a
REFUSED ................................................................. 97

A6a. Would you say this company employs...[READ OPTIONS]

- Less than 50 ................................................................. 01
- 50 TO 99 ................................................................. 02
- 100 TO 149 ............................................................... 03
- 150 TO 199 ............................................................... 04
- 200 TO 250 ............................................................... 05
- More than 250 ........................................................... 06

DON’T KNOW ................................................................. 98
REFUSED ................................................................. 97

A7. Are all of the workers full time workers?

YES ................................................................. 01
NO ................................................................. 05 \rightarrow GO TO A7a

DON’T KNOW ................................................................. 98
REFUSED ................................................................. 97

A7a. How many workers work less than full-time?

____ Number of employees less than full time

DON’T KNOW ................................................................. 98 \rightarrow GO TO A7b
REFUSED ................................................................. 97

A7b. Which of the following categories best describes the number of part-time workers?

- Less than 5 ................................................................. 01
- 5 TO 9 ................................................................. 02
- 10 TO 19 ............................................................... 03
- 20 TO 49 ............................................................... 04

- NO ........................................................................................................................... 05
- DON’T KNOW .......................................................................................................... 98
- REFUSED ................................................................................................................ 97

D1c What is the name of the other programme?

_________________________________________________
_________________________________________________
D2  About how many times has a CONSULTANT visited your firm in the last 6 months before the Working Time Initiative workshop?

__________ times

IF NO ANSWER, SUGGEST CATEGORIES:

Never ................................................................. 01
1-2 times ............................................................. 02
3-5 times ............................................................. 03
6-10 times ........................................................... 04
More than 10 times .............................................. 05

DON’T KNOW ......................................................... 98
REFUSED ............................................................ 97

D3  On average, how much time did he/she spend at the firm during a typical visit?

__________ hours

IF NO ANSWER, SUGGEST CATEGORIES:

Less than 1 hour .................................................. 01
1-2 hours ............................................................. 02
3-4 hours ............................................................ 03
5-6 hours ............................................................ 04
More than 6 hours ................................................. 05

DON’T KNOW ......................................................... 98
REFUSED ............................................................ 97

D4  Has the firm changed the way it operates as a result of the CONSULTANT’s inputs?

YES ....................................................................... 01
NO ........................................................................ 05

DON’T KNOW ......................................................... 98
REFUSED ............................................................ 97

D5  Has the firm changed its working time arrangements as a result of the CONSULTANT’s inputs?

YES ....................................................................... 01 → GO TO D5a
NO ........................................................................ 05

DON’T KNOW ......................................................... 98
REFUSED ............................................................ 97
D5a  Please explain how ____________________________________________

D6  Did the CONSULTANT help your firm to achieve your its objectives?

YES……………………………………………………………………………… 01
NO ………………………………………………………………………………… 05

DON’T KNOW ……………………………………………………………… ... 98
REFUSED……………………………………………………………………... ... 97

D7  Is there anything else you would like to tell us about your experience with any consultant services (including the SCORE program)?

D8  Do you know the name of your consultant(s) for the Working Time Initiative?

YES  ………………………………………………………………………………… 01 \rightarrow GO TO D8a
NO  ………………………………………………………………………………… 05

DON’T KNOW …………………………………………………………………... 98
REFUSED…………………………………………………………………………... 97

D8a  What is his name?

SECTION E- Employers’ Views

E1. Some people think that changes to working hours or work patterns can have an effect on the firm or its employees. I am going to read you a number of statements. Thinking of your company, please tell me how strongly you agree or disagree with each statement. Tell me if you (a) Strongly Agree, (b) Agree, (c) Neither agree nor Disagree, (d) Disagree, or (e) Strongly Disagree.

Changing working time arrangements can:

<table>
<thead>
<tr>
<th></th>

Interviewer ____________________  Date ____________________
INTRODUCTION
Hello, my name is (NAME), and I’m from IMPAQ International, a research firm conducting a study to assess the results of the Working Time Initiative for the International Labour Organization (ILO). I would like to ask you some questions about your firm’s working time arrangements.

Your answers will be kept confidential and only reported to the ILO as grouped data.

SECTION A- Employer Characteristics

I’d like to start with some general questions about this company.

A1 Our records show that the company name is [COMPANY]. Is that correct?

YES ........................................................................................................ 01
NO ........................................................................................................ 05 → GO TO A1a

DON’T KNOW .................................................................................. 98 → GO TO A1a
REFUSED ............................................................................................ 97

A1a What is the name of your [COMPANY]?

______________________________________________________________

A2 What is your name? __________________________________________

A3 What is your position at [COMPANY]? Are you [READ OPTIONS]:

MANAGER .......................................................................................... 01
SUPERVISOR ...................................................................................... 02
PRODUCTION WORKER ...................................................................... 03
CLERICAL WORKER ........................................................................... 04
ADMINISTRATION WORKER ............................................................ 05
Other position (specify__________________________________) .......... 06

DON’T KNOW .................................................................................. 98
REFUSED ............................................................................................ 97

A3a What Department do you work in? Please specify

______________________________________________________________

DON’T KNOW .................................................................................. 98
REFUSED ............................................................................................ 97
A3b  What kind of work do you do? Please describe

________________________________________________________________________

DON’T KNOW ................................................................. ...  98
REFUSED ...........................................................................  97

A4  How many years have you worked at this company?

______ Number of years

DON’T KNOW .................................................................  98 \rightarrow GO TO A4a
REFUSED ...........................................................................  97

A4a  Would you say you have worked at this company...[READ OPTIONS]

Less than 1 year .............................................................. ...  01
1-5 years ...........................................................................  02
6-10 years .......................................................................  03
11-20 years ......................................................................  04
More than 20 years ........................................................  05

DON’T KNOW .................................................................  98
REFUSED ...........................................................................  97

A5  Since you started working at this company until the end of 2012, did your salary increase, remain the same, or decrease?

INCREASED .......................................................................  01
REMAINED THE SAME .........................................................  02
DECREASED .......................................................................  03

DON’T KNOW .................................................................  98
REFUSED ...........................................................................  97

A6  Since the beginning of 2013, has your salary increased, remained the same, or decreased?

INCREASED .......................................................................  01
REMAINED THE SAME .........................................................  02
DECREASED .......................................................................  03

DON’T KNOW .................................................................  98
REFUSED ...........................................................................  97
Now I am going to ask you some questions about recent changes in the number of workers in this company. If you don’t know the exact answer, please provide your best estimate.

A7  During the last six months, were any workers laid off by the company?

YES ...........................................................................................................  01 → GO TO A7a
NO ........................................................................................................  05

DON’T KNOW .................................................................................  98
REFUSED .........................................................................................  97

A7a  How many workers were laid off in the last six months? ____

DON’T KNOW .................................................................................  98 → GO TO A7b
REFUSED .........................................................................................  97

A7b. How many would you say quit or were laid off...

Less than 5 .........................................................................................  01
5 TO 9 .................................................................................................  02
10 TO 49 ..........................................................................................  03
50 TO 99 ...........................................................................................  04
100 TO 250 ......................................................................................  05
Greater than 250 ...............................................................................  06

DON’T KNOW ..................................................................................  98
REFUSED .........................................................................................  97

A8  During the last six months, did any workers quit voluntarily at the company?

YES ......................................................................................................  01 → GO TO A8a
NO ....................................................................................................  05

DON’T KNOW ..................................................................................  98
REFUSED .........................................................................................  97

A8a  How many workers quit in the last six months? _____

DON’T KNOW ..................................................................................  98 → GO TO A8b
REFUSED .........................................................................................  97
A8b. How many would you say quit ...
