

FIJI

EMPLOYMENT AND ENVIRONMENTAL SUSTAINABILITY FACT SHEETS 2019

The Employment and Environmental Sustainability Fact Sheets series provides key features of employment and environmental sustainability performance. Jobs that are green and decent are central to sustainable development and resource productivity. They respond to the global challenges of environmental protection, economic development and social inclusion. Such jobs create decent employment opportunities, enhance resource efficiency and build low-carbon, sustainable societies. The fact sheets include the most recently available data for selected indicators on employment and environmental sustainability: (i) employment in environmental sectors; (ii) skill levels; (iii) vulnerability of jobs; (iv) jobs in renewable energy; (v) scoring on the Environmental Performance Index; and (vi) air quality.

DEMOGRAPHICS

Fiji¹ is a small island nation located in the southern Pacific Ocean (Fig. 1). Its population is mostly urban and growing, with a fertility rate of 2.5 children and life expectancy of 70.6 years. Around 65 per cent of the population is of legal working age (15–64 years) (Fig. 2).

Figure 1. Map of Fiji

Figure 2. Fiji population statistics

Population:² 0.9 million

Population growth rate	Fertility rate	Life expectancy at birth
0.75%	2.5 children	70.6 years

Population age categories

Note: Data is for 2017 except fertility rate and life expectancy (2018 data).

¹ Fiji became a member of the International Labour Organization in 1974.

² Population data based on 2017 data.

LABOUR FORCE

In 2018, the labour force participation rate was 58.1 per cent and the employment-to-population ratio was 54.57 per cent. Both these rates are more than 34 percentage points higher for men than for women. The total unemployment rate in 2016 was 4.31 per cent, and the youth unemployment rate was 18.76 per cent, with the female youth unemployment rate 12 percentage points higher than the male rate. The proportion of youths aged 15-24 years not in education, employment or training was 20.08 per cent in 2016.³ Employment is heavily reliant on services and agriculture, and on medium-skilled occupations (Fig. 3).

Figure 3. Basic employment statistics for Fiji, 2018

Employment-to-population, 2018 (15+ years)

Unemployment, 2018

Employment by sector, 2018 (15+ years)

Employment by occupation, 2018

Note: Total unemployment rate data is from 2016 and other data is from 2018.

Note: ILO estimates. Labour force participation rate and unemployment: aged 15 years and older. Youth unemployment: aged 15-24 years. Employment by occupation: skill level 1 (low) for elementary occupations; skill level 2 (medium) for clerical, service and sales workers, skilled agricultural and trade workers, plant machinists and assemblers; and skill levels 3 and 4 (high) for managers, professionals and technicians.

Source: ILO estimates and compilation using ILOSTAT, www.ilo.org/ilostat (accessed 23 November 2018).

Vulnerable employment in Fiji as of 2018 accounted for 38.3 per cent of the labour force, with the majority of those workers having own-account status (Fig. 4). Own-account and contributing family workers are more likely to experience low job and income security than employees and employers, as well as lower coverage by social protection systems and employment regulation.

Figure 4. Vulnerable employment, 2018

Note: ILO estimates. Vulnerable employment includes own-account workers and contributing family workers from ILO status of employment data.

Source: ILO estimates and compilation using ILOSTAT, www.ilo.org/ilostat (accessed 23 November 2018).

Rural population growth was 44.25 per cent in 2017. The share of agricultural land in total land area remained steady at 23 percentage points between 2000 and 2016, while agricultural employment increased from 0.133 million to 0.138 million people. The share of agricultural employment in total employment fell by approximately 8 percentage points due to much faster job creation in other sectors (Fig. 5).

Figure 5. Agricultural land and agricultural employment, 2000-2018

Note: data for agricultural land is from 2016 and other data is from 2018

ENVIRONMENTAL ISSUES

Fiji ranks at number 107 of 180 countries in the Environmental Performance Index (EPI),⁴ with a score of 53.09 (with 0 being furthest from the high-performance benchmark target of 100). Fiji outperforms the average score for Asia and the Pacific (Fig. 6) in some of the EPI categories, including air quality, heavy metals, fisheries, forests, water resources, and climate and energy. However, there is room for improvement, especially in environmental health (water and sanitation) and ecosystem vitality (biodiversity and habitat, air pollution and agriculture). Action to address climate change and improve environmental health, ecosystem vitality and resilience to weather disasters all have the potential to provide job creation, green economy growth and innovation in Fiji.

Figure 6. Environmental performance index for Fiji, 2018

Note: Score 0 (worst) – 100 (best). Asia-Pacific: data for ILO member states in the region, excluding Cook Islands, Marshall Islands, Palau and Tuvalu.

Forest area increased between 1990 and 2016, by approximately 3.7 per cent of total land area. From 1990 to 2017, the share of terrestrial protected area increased slightly, reaching 5.4 per cent of total land area. The proportion of marine protected area also increased slightly (Fig. 7). There will be greater prospects for employment opportunities if there is a commitment to transition to a low-carbon and resource-efficient economy, such as jobs in resource management and environmental services.⁵

Figure 7. Forest area, terrestrial and marine protection area, 1990-2017

Note: Data for forest area is from 2016 and other data is from 2017.

Source: ILO compilation using World development indicators, last updated: 28/06/2018; <http://databank.worldbank.org/data/reports.aspx?source=world-development-indicators#> (accessed on 18 March 2019).

Since 2000, there has been a slight decrease in access to basic drinking water, to an average of 93.7 per cent in 2015, and an increase in access to basic sanitation, to an average of 95.7 per cent in 2015 (Fig. 8). Both are still below the ideal threshold of 100 per cent. Only 0.3 per cent of the labour force was employed in water supply, sewerage, waste management and remediation activities in 2016 (Fig. 13). Improvement in water supply and sanitation access could provide decent job opportunities in the future.

Figure 8. Basic drinking water and sanitation access, 2000-2015

Growth of the urban population in Fiji has meant an increase in solid waste. Waste collection varies between the inner cities and the country's outer urban areas. According to the World Bank, municipal solid waste generation in Fiji in 2004 was 2.1 kilograms per capita per day and is expected to remain at 2.1 kilograms per capita per day to 2025.⁶ The majority of the waste in

⁵ Organisation for Economic Co-operation and Development: The jobs potential of a shift towards a low-carbon economy, OECD Green Growth Papers, No. 2012/01 (Paris, 2012), <http://dx.doi.org/10.1787/5k9h3630320v-en>.

⁶ World Bank: What a waste: A global review of solid waste management (Washington, DC, 2012).

1994 was organic (68 per cent), followed by paper and paperboard (15 per cent) (Fig. 9). The much-needed implementation of a municipal waste management system for collection, safe and sustainable disposal, recycling and composting practices could create more green jobs that help the environment and general health.

AIR QUALITY

The carbon dioxide (CO₂) emission levels for Fiji have increased gradually by an average of 2 per cent from 1990 to 2014 (Fig. 10).⁷ The increase was due primarily to: the transport sector; agriculture; and energy industries.⁸ The level of emissions since 1990 is so much lower than the Asia-Pacific and ASEAN averages that it appears negligible.

The PM_{2.5} (atmospheric particulate matter with a diameter of less than 2.5 micrometres) emission levels for Fiji remained steady, with a slight increase in 2005 (Fig. 11). Overall PM_{2.5} emission levels did not exceed the World Health Organization's Air Quality Guideline threshold level, thus indicating low emissions. Fiji also shows lower levels of emission than the ASEAN and Asia-Pacific averages. Increased vehicular traffic, diesel fuel used by local industries and widespread household burning of waste are the major sources of PM_{2.5} emissions in Fiji.⁹

Figure 10. CO₂ emissions for Fiji, 1990-2014

Applying the Just Transition Guidelines, an area of possible intervention includes efforts to reduce harmful emissions, which could potentially generate green jobs in high emitting sectors such as transportation and fuel-intensive industries. Reducing emissions is a significant challenge, which can be achieved not only by mitigation methods, but also by adapting to, and coping with, the changes required by the transition to a low-carbon economy.

⁷ The value is calculated on the basis of CAGR (compound annual growth rate).

CLIMATE CHANGE IMPACTS

According to the *World Risk Report*,¹⁰ Fiji has a very high World Risk Index score. It ranks number 15 of 171 countries because of its high exposure to natural hazards and limited institutional capacity to cope and adapt. Part of the country's vulnerability relates to the 4.9 per cent of the total population who, in 2010, lived in the 3.1 per cent of the total land area below 5 metres above sea level.¹¹

According to the *Emergency Events Database*,¹² there was a fluctuation in natural disasters¹³ and associated damage costs between the 1980s and 2018 (Fig. 12). The natural disasters in that time were mostly tropical cyclones, floods, droughts, earthquakes and tsunamis. Developing preventative measures to limit infrastructure and property damage and increase institutional capacity to respond to climate events, particularly for small businesses, can be a source of decent job creation while building resilience.

GREEN JOBS POTENTIAL

In 2016, 19.1 per cent of total employment was in the agriculture, forestry and fishing sector (Fig. 13). Although reliance on agriculture is significant, there are opportunities for job creation in sustainable production and organic farming.

Figure 13. Employment in sectors with strong green jobs potential in 2016

Note: These sectors have the most potential for green job opportunities. Employment by selected 1-digit sector level (ISIC - Rev. 4, 2008).

Source: ILO estimates and compilation using ILOSTAT, www.ilo.org/ilostat (accessed 23 November 2018).

In 2016, 40 per cent of the population relied primarily on clean fuel and technology, in the sense that these do not create pollution within the home.¹⁴ The share of renewable energy in total energy consumption has not kept pace with overall consumption. In 2000, it was 53 per cent but fell below 30 per cent in 2010 and, after some fluctuation, reached 31.26 per cent in 2015 (Fig. 14). However, renewable energy electricity generation has increased over the last 16 years, with hydropower being the main renewable energy source in 2016 (Fig. 15). The country's employment rate in electricity, gas, steam and air conditioning was only 0.1 per cent in 2016 (Fig. 13). With the push for increasing reliance on renewable energy, there is the potential for decent job opportunities in the future.

¹³ Climatological, hydrological and meteorological disasters.

¹⁴ The proportion of the population with primary reliance on clean fuels and technology is calculated as the number of people using clean fuels and technologies for cooking, heating and lighting divided by the total population reporting any cooking, heating or lighting, expressed as a percentage. "Clean" is defined by the emission rate targets and specific fuel recommendations (against unprocessed coal and kerosene) included in the normative World Health Organization guidelines for indoor air quality; see the data for household fuel combustion, <https://unstats.un.org/sdgs/metadata/files/Metadata-07-01-02.pdf>.

Better data collection relating to the green economy and the environmental sector would be very valuable for policy-makers in Asia-Pacific countries. In particular, better data on green and decent jobs is needed to assess the impact of climate change and climate-related policies on social inclusion. Without better data it will be difficult to determine what policy changes are needed to ensure a just transition to environmental sustainability and to monitor progress going forward.
