

Occupational injuries statistics from household surveys and establishment surveys, ILO manual on methods

ISBN 978-92-2-120439-8

This manual aims to assist those responsible for compiling data on occupational injuries with newly developed tools for collecting these data from household surveys and establishment surveys, to supplement the data compiled through notification systems. A second aim of the manual is to enhance compatibility of data between countries by encouraging the application of the latest international statistical standards, which form the basis of the new methodological tools.

The manual provides:

- Practical guidance for the production of statistics on occupational injuries through household surveys and establishment surveys
- In-depth explanation of the concepts underlying the statistics, as well as types of data, classification schemes, calculation of indicators and other important aspects, including international standards
- Step-by-step approach for developing household and establishment surveys and processing and disseminating the data
- Model questionnaires and training materials

Table of contents

Foreword
Acknowledgements
Acronyms
Chapter 1: Introduction
Chapter 2: International guidelines
Chapter 3: Concepts and definitions
Chapter 4: Scope and coverage
Chapter 5: Types of data and measurement
Chapter 6: Indicators
Chapter 7: Factors affecting choice of data collection approach
Chapter 8: Household surveys
Chapter 9: Establishment surveys
Chapter 10: Data processing and analysis
Chapter 11: Presentation and dissemination of results
Afterword
