# Sampling

## Sampling Procedure

---

A Stratified Two - Stage Sampling was adopted for the survey. Provinces were constituted strata. The primary and secondary sampling units were enumeration areas (EAs) for municipal areas and non-municipal areas and private households/persons in the collective households respectively.

### Stratification

Provinces were constituted strata. There were altogether 77 strata. Each stratum was divided into two parts according to the type of local administration, namely municipal areas and non - municipal areas.

### Selection of primary sampling unit

The sample selection of enumeration areas were performed separately and independently in each part by using probability proportional to size - total number of households. The total sample enumeration areas was 5,970 from 127,460 EAs.

### Selection of secondary sampling unit

Private households were the ultimate sampling units. A new listing of private households was made for every sample enumeration area to serve as the sampling frame. In each sample EAs, a systematic sample of private households were selected with the following sample size:

Municipal areas: 16 sample households per EAs

Non-municipal areas: 12 sample households per EAs
