Overview

ABSTRACT

The Labour Force Survey (LFS) in Albania has been carrying out by INSTAT since 2007 with annual periodicity. The survey is household-based and the unit of observation are all household members aged 15 years and older. The main objective of LFS is to establish a sustainable labour market statistics system according to EUROSTAT recommendations and guidelines.

Based on the data gathered through LFS it is possible to make a quantitative and dynamic assessment of labour market developments, to define the participation of all persons aged 15 years and over in labour market, the employment rate, the employment by economic activity, by sex and age-group, unemployment rate, women participation in labour market, etc.

KIND OF DATA

Sample survey data [ssd]

UNITS OF ANALYSIS

The Labour Force Survey (LFS) have the following units of analysis: individuals and households.

Scope

Sampling

Sampling Procedure

The sample is based on a two-stage sampling procedure. In the first stage are selected the geographical areas (PSU) with a proportional probability to the size of the enumeration area. In the second stage within each geographical areas (once selected in the first stage) are selected a fix number of households by equal probability systematic sampling method.

The sampling frame for LFS is based on the Population Census of 2001 and the updated household list. The sample selection was made in two stages; in the first step were selected the geographical areas and in the second stage were randomly selected the households inside these areas. The sample size for LFS 2012 was 5040 household for each calendar quarter of 2012. During 2012 the LFS became a quarterly survey, with a rotating sampling scheme, in order to provide reliable quarterly estimates on employment and unemployment at national level.

Deviations from Sample Design

Albania's LFS is carried out on a continuous basis since 2012, with a quarterly sample which is:

- a) spread evenly throughout all reference weeks of the quarters and of the year;
- b) representative of the whole target population; and c) with a full geographical coverage.

Response Rate

According to the table below, the selected households shows that the answered of the LFS questionnaire is equal to 65.1 percent.

Annual non-response rates by survey waves

Period Non-response rates by survey waves (%)

Wave 1 Wave 2 Wave 3 Wave 4 Wave 5

Annual average 2012 32.0 34.9 33.9 30.9 28.4

Weighting

The LFS methodology is in full accordance with the EUROSTAT standards and guidelines as regards to the representation of sample, coefficient of the variation of the main indicators, the drafting and the weighting of data. The sampling weights are calculated following several steps and take into account the sample design, adjustment for the household level no-responses, and the calibration with the demographic data. For the Labour Force Survey data weighting procedure is used the population calculated based on the Population and Housing Census, and on the demographic events (births and deaths) provided by the General Directory of Civil Status.

Questionnaires

Overview

The Questionnaires for the LFS includes the following modules:

- HOUSEHOLD MEMBERS: List of demographic characteristics of household members.
- INDIVIDUAL QUESTIONNAIRE: For all persons aged 15 years old and over on last day of the reference week and usually present in the household. This module includes: Labour Status, Characteristics of Main Job, Working Time, Second Job, Work Patterns, Work Experience Abroad, Previous Work Experience of Persons Not in Employment, Search For Employment, Education and Training, School-To-Work Transition of Young People Module, First Significant Job After First Leaving Formal Education, School-To-1st Significant Job Transition Period and Situation One Year Ago.

Data Collection Notes

The data collection changed from PAPI to CAPI using small electronic devices (PDA), thus making it possible to provide more frequent and timely LFS statistics. Based on this change INSTAT is publishing quarterly labour market indicators starting from the first quarter of 2012.

- Data collection in the fieldwork is spread across all months of the year.
- The gathered data refers to a specific reference period named reference week. The reference week is the calendar week which starts on Monday and finishes on Sunday before the interview day.
- The main mode of data collection is face to face personal interview (paper and pencil)
- The number of Ultimate Sampling Units (USU) interviewed per interviewer per day are three units.
- The average duration of an interview per household member of working age is 25 minutes
- The field staff is mainly recruited for the Survey collection
- The duration of training on the survey for newly recruited interviewers is three days
- Respondents' participation in the survey is compulsory
- Ultimate sampling units that could not be identified are replaced
- Ultimate sampling units that could not be contacted or refuse to participate aren't replaced

Questionnaires

The Questionnaires for the LFS includes the following modules:

- HOUSEHOLD MEMBERS: List of demographic characteristics of household members.
- INDIVIDUAL QUESTIONNAIRE: For all persons aged 15 years old and over on last day of the reference week and usually present in the household. This module includes: Labour Status, Characteristics of Main Job, Working Time, Second Job, Work Patterns, Work Experience Abroad, Previous Work Experience of Persons Not in Employment, Search For Employment, Education and Training, School-To-Work Transition of Young People Module, First Significant Job After First Leaving Formal Education, School-To-1st Significant Job Transition Period and Situation One Year Ago.

Data Processing

Other Processing

Some of the selected indicators tabulated from the survey are:

- Unemployment rate by sex, age, level of education, economic activity
- Employment to population ratio by sex, age, level of education
- Labour force participation rate by sex, age, level of education
- Hours of work (per worker) by sex, age, level of education, economic activity, occupation, status in employment
- Earnings (per worker) by sex, age, level of education, economic activity, occupation, status in employment
- Number of workers by hours band
- Number of workers by earnings class

Also, an adjustment for item non-response is made and the confidence level is 95 percent.

Data Appraisal

Estimates of Sampling Error

The calculation of the sampling errors for LFS estimates is based on the following principle: the variance contributed by the later stages of sampling is, under broad conditions, reflected in the observed variation among the sample results for the first-stage units. Thus, the sampling variance of a variety of statistics, such as totals, means, ratios, proportions, and their differences can be obtained on the basis of totals calculated for primary sampling units (PSUs).
