Overview

ABSTRACT

The Labour Force Survey (LFS) is a statistical study of the households selected by the appropriate method. The objective of the survey is providing information on not only well-known employment and unemployment as well as providing comprehensive information on other standard indicators characterizing the country labour market. The survey was carried out by the aim to derive the more real picture of main quantitative and qualitative characteristics of Armenian labour market. Having complemented the current questionnaire by special group questions, the following was observed within the survey frame:

1. informal sector employment;
2. informal (hidden) employment;
3. households' employment outside the informal sector;
4. Informal employment outside the informal sector.

Sampling

Sampling Procedure

A two stage stratified sample by regions (marzes) has been designed to conduct the survey. The method of systematic probability sampling was used to frame the sample. Yerevan and all marzes with rural and urban settlements were covered by sample population with proportion of all HH available in these strata. Based on the administrative and territorial division of RA at the first stage of sampling, the preliminary sampling units, i.e. enumeration areas were selected. 2001 Armenian Population Census results were used to calculate the mentioned proportions. At the second stage of sampling the primary sampling units, that are HHs to be surveyed, were randomly selected. As a result, during the year have been surveyed 7 680 HHs (monthly 640 HHs), of which 5 160 urban and 2 520 rural areas. At the same time a reserve sample was selected by the same steps, because it was anticipated that in most cases the questionnaire may not be completed due to household's refusal to participate in the survey, absence from the republic or other reasons. As a result, the HHs not participated in the survey were replaced from the reserve sample. The selection of households (HH) has been done monthly by the rotation principle. The unit corresponds to persons between 15-75 ages in HH, by annual coverage of 33000 persons (through direct visits to HH) by using exhaustive database of HH addresses for the sample.

Deviations from Sample Design

Relatively less popular phenomena objectively have less chance to be included in the sample because of its limited size. Therefore data at a high level of disaggregation (e.g. the simultaneous crossing of several variables) may have limited or insufficient representativeness. Similarly, the quarterly survey data (annual sample per quarter) are representataive only by large grouping of indicators because of the small sample size. The sampling method doesn't give full opportunity to provide adequate coverage for all the types of economic activity or occupation, since the sample is not stratified according to these variables. The indicators describing the popoulation's economic activity status are based on a respondents' answers, personal (subjective) assessment of standardized questionnaire. In some cases the answers are received not directly from the respondent, but are based on the answers of other adult from HH (proxy answers). As a result, the received data in some cases can differ from reality.

Response Rate

The survey is carried out throughout the whole year on the rotation principle. The survey unit is the household (HH) and not the person. Monthly sample size is 656 HH and the annual sample size in 2010 was 7872 HH. The response rate (participation) is about 92 %.

Weighting

The survey results are weighted and extrapolated to the general population. The main survey data is accompanied with information on standard error, which expresses the reliability range of indicator with some +/- sampling error. Information on sample error margin is important, since the user has an opportunity to assess the "risk factor" of the applied indicator. The 95% reliability range is applied, which means that in case of 100 times repetition of the same survey, the indicator for 95% will be identical and for 5% the indicator will go up or down from the mentioned margin.

Questionnaires

Overview

The design of the questionnaire, used concepts, set of indicators and calculation methodology, sampling method basically comply with the definitions and concepts recommended by the ILO and Eurostat, while taking into account the peculiarities of their application in Armenia to the extent possible, at the same time, by providing the comparability with the international similar indicators.

Data Collection Notes

- Observation period is all the weeks of all the months of the year.
- Reference period is the last one week preceding the survey, from Monday to Sunday including).

Questionnaires

The design of the questionnaire, used concepts, set of indicators and calculation methodology, sampling method basically comply with the definitions and concepts recommended by the ILO and Eurostat, while taking into account the peculiarities of their application in Armenia to the extent possible, at the same time, by providing the comparability with the international similar indicators.

Supervision

For the best implementation of field and post-field survey work, special training courses were organized for the working group.

Data Processing

Data Editing

The following parts of the survey had been subject to partial changes over the time:

- a) sample size
- b) time period
- c) surveyed population/age group of respondents
- d) survey questionnaire
- e) calculation methodology of some indicators.

Other Processing

The mentioned must be taken into consideration in time series during data comparison. Hence, a) size of HH sample population during 2001- 2006 fluctuated between 0.1-0.3% of the general population, but starting from year 2007, it formed 1% of the general population, b) in 2001-2003 and in 2006 LFS was conducted on quarterly basis; in 2004 it was conducted only in August, in 2005 only November and December were observed. Starting from 2007 the labor force survey is conducted on monthly basis through HH ILCS, c) in 2001-2003 household members between the ages of 16-70 have been observed, in 2004-2006 between the ages of 15- 70, in 2007 persons 16 years and older and starting from 2008 persons between 15-75 ages are observed, d) since 2008, the calculation of unemployment indicator is implemented according to standard definition of unemployment defined by ILO, as a result of which the latter is not comparable with the previous years indicator.

Data Appraisal

Estimates of Sampling Error

The survey results have some sampling errors, which are the results of the following:

- a) The address database which was formulated as a result of 2001 Population Census in Armenia is being updated once every ten years;
- b) The refusals of HH/persons to take part in survey;
- c) Incomplete answers, etc.

Information on sample error margin is important, since the user has an opportunity to assess the "risk factor" of the applied indicator. The 95% reliability range is applied, which means that in case of 100 times repetition of the same survey, the indicator for 95% will be identical and for 5% the indicator will go up or down from the mentioned margin.
