VERSION DESCRIPTION

Version 01

Overview

ABSTRACT

Focuses mainly on labour force key indicators, main characteristics of the employed, unemployed, underemployed and persons outside labour force, labour force according to level of education, distribution of the employed population by occupation, economic activity, place of work, employment status, hours and days worked and average daily wage in NIS for the employees.

KIND OF DATA

Sample survey data [ssd]

UNITS OF ANALYSIS

- Household

- Individual

Scope

NOTES

The lfs questionnaire consists of four main sections:

Identification Data:

The main objective for this part is to record the necessary information to identify the household, such as, cluster code, sector, type of locality, cell, housing number and the cell code.

Quality Control:

This part involves groups of controlling standards to monitor the field and office operation, to keep in order the sequence of questionnaire stages (data collection, field and office coding, data entry, editing after entry and store the data.

Household Roster:

This part involves demographic characteristics about the household, like number of persons in the household, date of birth, sex, educational level...etc.

Employment Part:

This part involves the major research indicators, where one questionnaire had been answered by every 10 years and over household member, to be able to explore their labour force status and recognize their major characteristics toward employment status, economic activity, occupation, place of work, and other employment indicators.

TOPICS

Gender	ILO	

KEYWORDS

Unemployed, Employed, Occupation, Economically active population (Labour Force)

Coverage**GEOGRAPHIC COVERAGE**

The Data are representative at region level (West Bank, Gaza Strip), locality type (urban, rural, camp) and governorates.

UNIVERSE

The survey covered all the Palestinian households who are a usual residence in the Palestinian Territory.

Producers and Sponsors**PRIMARY INVESTIGATOR(S)**

Name	Affiliation
Palestinian Central Bureau of Statistics	Palestinian National Authority

OTHER PRODUCER(S)

Name	Affiliation	Role
Palestinian Central Bureau of Statistics	Palestinian National Authority	Product the survey

FUNDING

Sampling

Sampling Procedure

Sampling Frame

The methodology was designed according to the context of the survey, international standards, data processing requirements and comparability of outputs with other related surveys.

Sampling Frame and Target Population:

Target Population:

All Palestinians aged 10 years and over living in the Palestinian Territory, excluding persons living in institutions such as prisons or shelters.

Sampling Frame:

The sampling frame consisted of a master sample of enumeration areas (EAs) selected from the population housing and establishment census 2007, the master sample consists of area units of relatively equal size (number of households), these units have been used as primary sampling units (PSUs).

Deviations from Sample Design

Sample Design:

The sample is a two-stage stratified cluster random sample.

Stratification:

Two levels of stratification were made:

Stratification by Governorates.

Stratification by type of locality which comprises:

(a) Urban (b) Rural (c) Refugee Camps

Response Rate

Sample Size:

The sample size was about 7,552 households in the 44th round and 45th round, while the sample size the 46th round and the 47th round consisted of 7,546 households, the total number of the households about 30,196 households, the number of completed questionnaires about 25,530 questionnaires, this number considered appropriate to provide estimations on main labour force characteristics at Palestinian Territory. " The overall response rate for the survey was 90.1%

Weighting

Calculation of Households Weights:

The weight of statistical unit (sampling unit) in the sample is defined as the mathematical inverse of the selection probability. The sample of the survey is two stage stratified cluster sample, thus, the weights are calculated for each stage and the Households Weights is the multiplication of the two weights.

First stage weight:

The sample of enumeration areas is selected and the weight is called enumeration area weight (the sampling unit is enumeration area). The weight for enumeration areas from stratum h is calculated by dividing the number of enumeration areas in stratum h on the sample size of enumeration areas in stratum h.

Second stage weight:

The sample of households is selected and the weight is called household weight (the sampling unit is household). The weight of the Household from enumeration area (cluster) k is calculated by dividing the number of households in each cluster with

the sample size of households within the cluster k.

The primary weight of households before modification is the multiplication of the weights of the first and second stages.

Then we adjust the primary weights for the households to compensate for the non-response of households by calculating adjustment factor for households weights for adjustment levels (Governorate and locality type) by using households projections by adjustment levels in 2006.

Then the final weight for the households (FHW) is a multiplication of the adjustment factor by the primary weights for the household

"The persons weights were adjusted according to population estimates on the level of Region , Sex, and Age groups. "

Questionnaires

Overview

The questionnaire included four parts: one for recording necessary elements for survey management and controls, another part for identifying the sample households, one for recording the household roster and the demographic characteristics of household members, and one for recording labour force characteristics of working age household members

Data Collection

Data Collection Dates

Start	End	Cycle
2007	2007	N/A

Time Periods

Start	End	Cycle
2007-01-01		Q1
2007-04-01		Q2
2007-07-01		Q3
2007-10-01		Q4

Data Collection Mode

Face-to-face [f2f]

Data Collection Notes

The purpose of the training courses was to teach participants the main skills needed to conduct interviews. Two training courses were held, one in Ramallah for the West Bank trainees, and one in Gaza City for Gaza Strip trainees. Each course consisted of two parts: one on survey methodology including survey design, questionnaire design, interviewing techniques, and field operations; and one part on specifications of the labour force survey, including concepts and definitions, fieldwork procedures, data collection, editing, coding, tips for asking questions and recording answers, as well as field team organization and field supervision. The training courses included lectures and field exercises. Each course lasted 3 days, training 20 interviewers and 4 supervisors.

Questionnaires

The questionnaire included four parts: one for recording necessary elements for survey management and controls, another part for identifying the sample households, one for recording the household roster and the demographic characteristics of household members, and one for recording labour force characteristics of working age household members

Supervision

The purpose of the training courses was to teach participants the main skills needed to conduct interviews. Two training courses were held, one in Ramallah for the West Bank trainees, and one in Gaza City for Gaza Strip trainees. Each course consisted of two parts: one on survey methodology including survey design, questionnaire design, interviewing techniques, and field operations; and one part on specifications of the labour force survey, including concepts and definitions, fieldwork procedures, data collection, editing, coding, tips for asking questions and recording answers, as well as field team organization and field supervision.

Data Processing

Data Editing

Data editing took place at a number of stages through the processing including:

1. office editing and coding
2. during data entry
3. structure checking and completeness
4. structural checking of SPSS data files

Other Processing

Both data entry and tabulation were performed using the Blaise and SPSS software programs. Data entry was organized in one files, corresponding to the main parts of the questionnaire. A data entry template was designed to reflect an exact image of the questionnaire, and included various electronic checks: logical check, range checks, consisting checks and cross-validation. Complete manual inspection of results after data entry was performed, and questionnaires containing field-related errors were sent back to the field for correction

Data Appraisal

Estimates of Sampling Error

Since the data reported here are based on a sample survey and not on complete enumeration, they are subject to two main types of errors: sampling errors and nonsampling errors.

Sampling errors are random outcomes of the sample design, and are, therefore, easily measurable. A description of the estimated variances and the effects of the sample design on sampling errors are provided in the report and Table A. In general, the assessment is that the sample size and sample design provide reliable estimates of the main labour force indicators.

Other forms of Data Appraisal

Detailed information on the data appraisal is available in the Survey Report.
