Overview

ABSTRACT

The main objective of this 3rd census was to gather up-to-date and reliable data that could be immediately utilisable for the reconstruction of the country and for the more consistent planning towards a sustainable socio-economic development of the country. The main objective of the 2002 census was thus to fill this gap by providing updated data of good quality and within a reasonably short time, for use in the process of reconstruction of the country, but also for the planning towards a coherent and sustainable socio-economic development in the future.

The National Census Service has the pleasure to make available to the public, this document which represents the first among a series of publications which have been designed to disseminate the final results of the third General Census of Population and Housing which it conducted between the 16th and 30th of August 2002.

KIND OF DATA

Census/enumeration data [cen]

UNITS OF ANALYSIS

Persons

Scope

NOTES

The scope of this survey includes:

- Population Size and Distribution
- Socio-cultural Characteristics of the population
- Marital Status and Nuptiality
- Fertility
- Mortality
- Migration and urbanisation
- Characteristics of ordinary households
- Housing and its environment
- Educational characteristics of the population
- Economic Activity
- The situation of women in Rwanda

- The situation of elderly persons in Rwanda
- The situation of handicapped persons
- The situation of children in Rwanda
- Projections of the Population of Rwanda - 2002-2022
- The standard of living of households in Rwanda

Sampling

Sampling Procedure

At the dawn of the independence of Rwanda on the 1st of July 1962, its population had reached 2.9 million inhabitants. According to a national sample survey conducted in 1970, the population of the country was estimated to be 3.6 million inhabitants and the birth and death rates were estimated to be 52 and 22 per 1000 respectively.

Deviations from Sample Design

In order to ascertain the quality and reliability of the data collected during the 3rd Census in terms of coverage and content, a special quality-check field operation was organised three weeks after the field census count. This Post-enumeration Survey (PES) was conducted from the 23rd of September to the 2nd of October 2002 in strict conformity with the norms relating to sampling (using the updated national sampling frame, drawing a nationally representative sample, selecting a set of variables to be tested for coverage and content errors, etc...). A total of 120 EAs was sampled from 82 Districts. The procedure employed involved a one-stage stratified sample with three main strata: Kigali City, other urban areas and rural areas.

Response Rate

The PES revealed that the overall level of coverage of the 3rd Census was 97% and confirmed the consistency between the approaches and conditions under which the both field operations had been conducted.

Weighting

Between the three censuses of 1978, 1991 and of 2002, the ranking of the provinces in terms of their demographic weight has thus undergone significant changes due, in part, to the administrative restructuring of the national territory in the late 1990s.

Questionnaires

Overview

The census household questionnaire carried more than 50 questions or variables and on the average, each enumerator completed some 16 of them per day.

Data Collection

Data Collection Dates

Start	End	Cycle
2002	2002	N/A

Time Periods

Start	End	Cycle
2002-08-16	2002-08-30	N/A

Data Collection Mode

Face-to-face [f2f]

Data Collection Notes

The field data collection for the 3rd Census of Population and Housing, sanctioned by Presidential decree N° 43/01 of the 26/12/1999 later modified by the Presidential decree N° 28/01 of the 10/11/2000 was carried out all over the entire national territory from the 16th to the 30th of August 2002. It required the mobilisation of major sectors of the nation such as national and local authorities, teachers, the national police and security services, etc... In all, some 12000 field staff were deployed as enumerators, team leaders, controllers and supervisors to ensure the success of this crucial phase of the project.

Questionnaires

The census household questionnaire carried more than 50 questions or variables and on the average, each enumerator completed some 16 of them per day.

Supervision

The Census of August 2002 mobilised some 12000 field enumerators 2500 team leaders and controllers, 12 provincial supervisors, 4 regional coordinator, to gather information on every member of each household along with their housing conditions, using a questionnaire which was far more detailed than those of the censuses of 1978 and 1991. The National Census Service is the technical institution which was created to organise the preparation and conduct of the 3rd census and the processing and analyses of the data so collected.

The organisation and the technical and administrative supervision of all the phases of this project was entrusted on the National Census Service as the technical executing body being directly supervised in turn, by the National Census Commission presided over by the Ministry of Finance and Economic Planning. The National Census Service, in addition to the actual execution of all the phases of this project had the responsibility of initially conceiving its overall design and the calendar of each of its main activities and ensuring that they were scrupulously respected.

Data Processing

Data Editing

The coding, data entry and tabulation phases of data processing entailed prior special training of coders, data entry staff and computer analysts and programmers whom the Census Office had identified using specific criteria and testing.

The role of this staff was to participate in the various stages of processing of the data contained in the household questionnaires using adapted and the most recent computer equipment and applications which subsequently rendered data tabulations and analyses much easier.

Other Processing

Apart from the coverage errors mentioned above, other material or technical errors may come up during the various data collection, handling and processing phases and which need to be identified and corrected. This was done through the use of a computer program specially designed to detect coherence and consistency flaws in the data and to correct them. This process of data file cleaning and of imputation lasted for 3 months during which the staff of the computing unit worked in close collaboration with the Demographers and Statisticians of the Census Office

Data Appraisal

Estimates of Sampling Error

Experience has shown that various errors can be committed during the conduct of a population census operation. These can be as a result of double counting and/or of the omission of individuals or of entire households.
