Overview

ABSTRACT

The Labour Force Survey is a survey that collects data on the main characteristics of labour force, which are used to estimate the total labour force in our country. The main aim of the survey is estimating the labour force volume, i.e. employed and unemployed population, where employment relates to work in both formal and informal section. LFS also aimed at increasing preciseness of labour force contingents estimations, the statistical Office of the republic of Serbia (SORS), has started, since the beginning of 2016, applying the new methodology of estimating, i.e. weights calculations, by which sample is expanded on the level of populaton. The mentioned change has disabled comparisons of data series, and SORS has performed revision of 2014 and 2015 data, thus providing comparability, starting with 2014. Additionally, LFS deals with characteristics of employment (professional status of the employed persons, their activity, occupation, rights realized at work...) and unemployment (acquired education, duration of job seeking, previous working experience...), as well as characteristics of inactive population - their education, age, income source and readiness for involvement in labour market.

Sampling

Sampling Procedure

Sampling frame is based on data of the Census of Population, Households and Dwellings that was carried out in the Republic of Serbia in 2011. It is formed by excluding all enumeration areas with 19 or less households. The frame has been reduced by 1.5%. Sample type: A two-stage stratified, rotation panel sample is used in the Survey. The units of the first stage are enumeration areas, and those of the second stages are households. Stratification: Enumeration areas, as primary units, are stratified by type of settlements, into urban and other settlements, as well as by territory covered by the administrative districts. In the 1st quarter 2016, labour force survey was conducted on the sample of approximately 15 500 households.

Deviations from Sample Design

Stratification:

Enumeration areas, as primary sampling units, are stratified by the type of settlement (urban and other) and by territory at the NUTS 3 level (25 areas: Beogradska, Zapadnobačka, Južnobańska, Južnobačka, Severnobańska, Severnobačka, Srednjobańska, Sremska, Zlatiborska, Kolubarska, Macvanska, Moravicka, Pomoravska, Rasinska, Raška, Šumadijska, Borska, Branicevska, Zajecarska, Jablanicka, Nišavska, Pirotka, Podunavska, Pcinjska and Toplicka oblast).

Rotation scheme:

Labour Force Survey is based on the rotating panel design, by which each household participate in the sample for four times. The rotating scheme 2-2-2 was applied. For each quarter four subsamples (rotating groups) are allocated. Each quarter (Q) in the sample is included: one new rotating group, two rotating groups from the previous quarter (Q-1) and one rotating group from Q-3 quarter. Based on the applied rotating scheme, each household and person selected in the sample will be interviewed 4 times within 18 months, i.e. each household and person is in the sample for two consecutive quarters, then for two quarters out of the sample and again for two consecutive quarters in the sample.

Weighting

The estimation was based on two-stage stratified sampling design, assuming that the selection procedure for the first stage is proportional to the size with replacement, and for the second stage it is simple random sampling without replacement. The initial weights are results from the applied sampling design that was corrected for non-response. In order to reduce the effect of non-response and to obtain estimates for population that correspond to current demographic projections, the procedure of post-stratification was applied. By the end of 2014 the post-stratification was provided by area level (NUTS 3 level) and by age groups (0-14 and 15+). From the beginning of 2015 the post-stratification was provided by area level (NUTS 3 level), by five-years age groups (14 groups) and by sex (two groups).

Questionnaires

Overview

The questionnaire is the main tool for obtaining responses. In 2015, laptops are used in field work and telephones in the call centre. The source of data is the responses provided to interviewers. The survey is based on reporting method by means of the questionnaire ITR, which is to be filled in by every enterprise in the sample. The questionnaire is to be filled in for the enterprise as a whole, i.e. as total for all organisational parts, whether located on the same or another address.

Data Collection Notes

Starting from 1999 the Statistical Office of the Republic of Serbia has not at disposal and may not provide available certain data relative to AP Kosovo and Metohia and therefore these data are not included in the coverage for the Republic of Serbia (total). The survey is carried out every four year, and the accounting period is the previous financial year. The main source for data collection is accounting records of enterprises about paid earnings and other labour costs as well as other human resources and hours worked records.

Data Processing

Other Processing

The Statistical Office of the Republic of Serbia and the Institute of Statistics and Informatics of Belgrade is in charge of the preparation, organisation and carrying out of this survey, as well as of data processing. The persons directly involved in the survey are: interviewers, supervisors and trainers. In coding and processing the data of this Survey, used are the following classifications:

1. Classification of Activities, which is comparable with the UN classification of activities (ISIC - rev. 4) and EU classification (NACE, rev. 2),
2. Classification of occupations, which is comparable with the International Standard Classification of Occupations (ISCO 08),
3. List of schools, which is comparable with international levels of education and training (ISCED 2011), and
4. Classification employees' employment status, which is comparable with the International Classification in Employment (ICSE).

Data Appraisal

Estimates of Sampling Error

Estimates of totals, proportions, as well as errors thereof, are calculated for various indicators. In the dissemination phase it is not possible to publish each estimate with its sampling error. In order to provide users to evaluate the precision of the estimate, approximate values of sampling errors have been calculated based on regression model.
