### ABSTRACT

Labour Force Survey has been producing results since 1981 on a yearly basis (spring quarter). From 1998 onwards it is a continuous survey, providing quarterly results.

Labour force survey is a sample survey covering the population living in private households. The selection of households to be surveyed follows a two stage stratified sampling scheme. Total country is stratified in 182 strata. These strata are formed by allocating municipalities and communes of every NUTS 3 in three different groups (Agglomerations and Municipalities with 10.000 inhabitants or more, Municipalities and Communes with 2.000 to 9.999 inhabitants, and Communes up to 1.999 inhabitants). The exceptions are Athens and Thessaloniki agglomerations, which are divided into 31 and 9 strata, respectively. At the first sampling stage, 2640 clusters (groups of dwellings) are selected with probability proportional to their "size" (that is, proportional to the number of households residing in these areas at 2001 census). At the second sampling stage a systematic sample of dwellings is selected in every primary sampling unit. All households residing in selected dwellings are asked to participate in the survey. All the individuals who are members of the selected households are interviewed. Total sample size is about 30,000 households per quarter.

Statistical concepts and definitions

Employed are persons aged 15 years or older, who during the reference week had worked, even for just one hour, for pay or profit or they have worked in the family business, or they were not at work but had a job or business from which they were temporarily absent.

Unemployed are persons aged 15-74 who were without work during the reference week (they were not classified as employed), were currently available for work and were either actively seeking work in the past four weeks or had already found a job to start within the next three months.

Inactive are those persons who neither classified as employed nor as unemployed.

Self-employed with employees are persons who work in their own business, professional practice or farm for the purpose of earning a profit, and who employ at least one other person.

Self-employed person without employees are persons who work in their own business, professional practice or farm for the purpose of earning a profit, and who employ no other persons.

Employees are defined as persons who work for a public or private employer and who receive compensation in the form of wages, salaries, fees, gratuities, payment by results or payment in kind.

Family workers are persons who help another member of the family to run a farm or other business, provided they are not classified as employees (they are not receiving a salary, and they have not a direct profit from the business).

Part-time job , Full-time job. The distinction between these two forms of job is based on the spontaneous response of the respondent to a relevant question.

Temporary job. A job may be considered temporary if the employer and the employee agree that the termination of the job is determined by objective conditions such as a specific date, the completion of a task or the return of another employee who has been temporarily replaced. This agreement is not necessarily based on a written work contract.

Duration of unemployment is defined as the duration of search for a job, or the length of the period since the last job was held (if this period is shorter than the duration of search for a job).

Persons in education. A person is considered in education if he/she is following any educational program, including initial education, additional education, vocational education, continuing or additional training, training in enterprises, apprenticeships, on-the-job training, seminars and workshops, distance education, evening classes, self-learning, etc. Also are included courses for personal interest only, which may cover all forms of learning, and training in subjects such as languages, computer studies, business studies, art and culture, health and medicine.

#### Classification system

Economic activity, until 2007, was classified according to STAKOD 03 which is the Greek version of NACE Rev1.1. From 2008 onwards STAKOD 08 is used, which is identical (at 3 -digit level) to NACE Rev2. The classification is based on the 3-digit level for the main job, and on the 2-digit level for the second and previous job. Occupation, until 2011, was classified according to STEP-92, which is the Greek version of the International Standard Classification of Occupations - ISCO-88 (Com). From 2011 onwards, ISCO-08 is used. Classification is based on the 3-digit level for the main, second and previous job. Nationality and Country of birth are classified according to a specific classification used for the Labour Force Survey. Level of education is classified according to a specific classification used for the Labour Force Survey, which allows for the classification of educational level according to International Standard Classification of Education (ISCED 97). Field of education is classified according to ISCED 97 at 1 digit level (2 and 3 digits are used for special fields in science, and foreign languages) .

## Scope

---

#### NOTES

The main statistical objective of the Labour Force Survey is to divide the population of working age (15 years and above) into three mutually exclusive and exhaustive groups - persons in employment, unemployed persons and inactive persons. In addition, Labour Force Survey collects information on: demographic characteristics, main job characteristics, the existence and characteristics of a second job, educational attainment, participation in education, previous working experience and on search of job

#### Classification system

Economic activity, until 2007, was classified according to STAKOD 03 (S????? 03) which is the Greek version of NACE Rev1.1. From 2008 onwards STAKOD 08 (S????? 08) is used, which is identical (at 3 -digit level) to NACE Rev2. The classification is based on the 3-digit level for the main job, and on the 2-digit level for the second and previous job. Occupation, until 2011, was classified according to STEP-92 (S???-92), which is the Greek version of the International Standard Classification of Occupations - ISCO-88 (Com). From 2011 onwards, ISCO-08 is used. Classification is based on the 3-digit level for the main, second and previous job. Nationality and Country of birth are classified according to a specific classification used for the Labour Force Survey. Level of education is classified according to a specific classification used for the Labour Force Survey, which allows for the classification of educational level according to International Standard Classification of Education (ISCED 97). Field of education is classified according to ISCED 97 at 1 digit level (2 and 3 digits are used for special fields in science, and foreign languages) . Geographical areas are classified according to NUTS classification.

### GEOGRAPHIC COVERAGE

Geographical areas are classified according to NUTS classification.

All NUTS 3 areas of Greece, with the exception of Mount Athos area

### UNIVERSE

Population residing in private households, and staying (or intend to stay) at least 1 year in Greece. Individuals who permanently reside in collective houses (i.e. hospitals, hotels, asylums, homes for the elderly, orphanages, etc) are not covered by the survey.

# Sampling

## Sampling Procedure

---

The Labour Force Survey's sample is spread uniformly in the 13 (or 14) weeks of the quarter. Every sampled household corresponds to a particular week, namely the reference week (from Monday to Sunday). For employment, the reference period is the reference week. For job search, working time arrangements, and participation in education, the reference period is the four-week period, ending with the reference week. For availability to start, or resume, a job the reference period is the two-week period after the reference week. For monthly estimates, the sample used is the sample that is allocated in the four (or five) reference weeks of the particular month. When the days of a week belong to two different months, this week is considered to belong to the month that includes that Thursday of the particular week. The sampling frame is based on the 2001 census results. The primary sampling units consist of a number of building blocks. The design and selection of the primary sampling units is based on the number of private households residing permanently in these areas at the 2001 census. The secondary sampling units (that is households and dwellings) are selected after the selection of the primary sampling unit and after the compilation of a complete list of the private household dwellings in the PSU. The list is updated every 6 quarters (when a new systematic sample of dwellings is selected in the primary sampling unit). The main issues pertaining to the frame quality are:

- The more the time interval elapses since the census, the less accurately the probabilities of

selection reflect the "real size" of the selected primary sampling units.

- Sample size can be different, and even significantly different from the expected size, due to considerable changes in the "size" (that is, the number of household dwellings) of a PSU.
- It is difficult to control the way listings are updated. Over-coverage and under-coverage can be both present. Undercoverage (the percentage of persons that are not covered by the sampling frame) is estimated at about 1%. These are mainly persons residing in collective households and persons residing in houses outside built-up areas. Overcoverage (the percentage of dwellings that are not used by households and are included in the sampling frame of Labour Force Survey) is estimated at about 8%.

Non response errors: Non response errors are due to non-contacts (failure to come into contact with the household) or to the refusal of the household to provide information.

Non response is compensated by weighting (at PSU) level, but is not clear if this compensation really "removes" all bias induced by non-response. Response errors: There are many factors that can lead to wrong (or false) answers provided by the respondents. The most important are:

- Sensitive questions (like the existence of a second job, income, receiving unemployment allowances, etc)
- Proxy answering, mostly for questions about the motives or wishes of a person
- Repeated interviewing of the same household for 6 consecutive waves imposes a serious burden on the interviewed households

### Data Collection Notes

Data are collected throughout the year. The year is divided in 4 quarters: 1st (January, February, March), 2nd (April, May, June), 3rd (July, August, September) and 4th (October, November, December). The quarterly sample is distributed uniformly in the 13 (or 14) weeks of the quarter.

The Labour force survey sample follows for a "rotational" pattern. Every quarter, the 5/6 of the sample remains the same, while the 1/6 is "rotated" - that is new households are interviewed. New households are interviewed by personal, face-to-face, interviews. Subsequent interviews of the same household (during the following quarters) can be carried out either by face-to-face interviews either by telephone. In both cases, a paper questionnaire is used.

#### Quality assurance

Labour Force Survey complies with Eurostat standards concerning the selection and the size of the sample, the design of questionnaires, the survey's frequency and the information collected. Collected questionnaires are checked for completeness and quality of information. The final data base is checked for data validity by ELSTAT and Eurostat. A change in data collection method is envisaged for the near future. Paper questionnaires are going to be replaced by electronic questionnaires in portable computers. This change will improve considerably the timeliness of survey results. Under consideration is also the use of a call center for repeated household interviews, a change in data collection, which will also improve the timely production of survey results and interview quality.

#### Quality assessment

Labour Force Survey is considered a reliable source of information with a methodology that meets high standards. Nevertheless, Labour Force Survey is a sample survey and as a result, the results are accompanied by sampling errors. Basic quality indicators of Labour Force Survey, (sampling errors, response rates) are computed quarterly and annually and included in a standard quality report submitted to Eurostat.

## Data Processing

### Data Editing

---

#### Comparability over time

Until 1997, the Labour Force Survey had been producing estimates on a yearly basis (spring quarter). From 1998 onwards the Labour Force Survey is a continuous quarterly survey. In 2004, the Labour Force Survey was redesigned on the basis of the 2001 census. In the same year, post-stratification of survey results was used for the first time, and the method of substitutions, for dealing with non-response was discontinued. The Labour Force Survey's sample was updated during 2009 - 2010. Major changes in the survey questionnaire during the last 10 years were: 1999: Introduction of variables that describe relationships between household members. Introduction of separate questions on "search-job" activities. Introduction of questions on employees salary. 2003: Introduction of questions on field of studies. 2006: Codification of sector of economic activity at 3-digit level. 2008: Introduction of NACE Rev2.

#### Coherence cross-domain

**Coherence of LFS data with registered unemployment:** There are differences between these estimates due to differences both in measurement and definitions. LFS is using the ILO concept of unemployment while Unemployment register includes a person if he has contacted the unemployment office and declared himself as unemployed. As a consequence, persons with "small" jobs or part-timers, can be included in registered unemployment. At the same time, it is not always the case that someone who is LFS unemployed is registered at the unemployment office. There are relatively small differences (register unemployment is higher) but both estimates show same trends at country level.

**Coherence of LFS data with National Accounts:** There are differences between the two estimates that are due to different definitions, concepts and coverage. National Accounts cover all population while LFS covers only population living in private households. National Accounts use LFS as the main source of data on employment but in certain cases, Business Surveys are also used. The National Accounts estimation for the number of persons in employment is slightly higher than the LFS estimation.

### Other Processing

---

Data are validated through a series of checks which detect inconsistencies between dates reported by interviewed persons, between educational attainment and profession, profession and sector of economic activities, inconsistencies between answers given to different parts of the questionnaire and inconsistencies in the reported structure of the households. When detected, these problems are resolved either by re-contacting households or, when possible, using previous data for the same household.

#### Data compilation

The Labour Force Survey results are produced by weighting sample data. Data weights are computed in a 3-step procedure. In the first step, a design weight is assigned to each person in the data file. This weight is determined by the estimated probability of selection of the particular household where the person lives. In the second step, a non-response correction factor is computed, at primary unit level:  $\text{Non response correction} = \frac{\text{number of eligible households in primary sampling unit}}{\text{number of households that responded}}$ . At the third step, data are post-stratified: Totals are computed for 208 post-stratification cells, which are defined by 13 NUTS 2 areas x 8 age groups x sex. These totals are estimated by weighting sample data (individuals) by design weights and non-response correction factor. Finally, post-stratification correction factors are computed for each individual so that estimations from Labour Force Survey are consistent with estimated population totals for post-stratification cells. These estimations are based on the 2001 census results, births, deaths and known migration.
