Overview

ABSTRACT

The Quarterly Labour Force Survey (QLFS) is a household-based sample survey conducted by Statistics South Africa (Stats SA). It collects data on the labour market activities of individuals aged 15 years or older who live in South Africa. This report presents the key findings of the QLFS conducted in 2011.

The questions in the LFS which are not included in the core QLFS questionnaire are currently under review and may be included as an annual supplement subject to stakeholder consultations. The QLFS sample covers the non-institutional population except for workers' hostels. However, persons living in private dwelling units within institutions are also enumerated. For example, within a school compound, one would enumerate the schoolmaster's house and teachers' accommodation because these are private dwellings. Students living in a dormitory on the school compound would, however, be excluded.

NB: This version of the study includes ILO standardized variables. The ILO Department of STATISTICS has developed a comprehensive framework for processing labour force survey microdatasets. Up to 34 standardized derived variables are generated from existing labour force survey microdatasets to allow for the production of internationally comparable labour market indicators.

Sampling

Sampling Procedure

The QLFS sample covers the non-institutional population except for workers' hostels. However, persons living in private dwelling units within institutions are also enumerated. For example, within a school compound, you would enumerate the schoolmaster's house and teachers' accommodation because these are private dwellings. Students living in a dormitory on the school compound would therefore be excluded.

Survey requirements and design :

The Labour Force Survey frame has been developed as a general purpose household survey frame that can be used by all other household surveys irrespective of the sample size requirement of the survey. The sample size for the QLFS is roughly 30 000 dwellings and these are divided equally into four rotation groups, i.e. 7 500 dwellings per rotation group.

The sample is based on information collected during the 2001 Population Census conducted by Stats SA. In preparation for the 2001 census, the country was divided into 80 787 enumeration areas (EAs). Some of these EAs are small in terms of the number of households that were enumerated in them at the time of Census 2001. Stats SA's household-based surveys use a Master Sample which comprises of EAs that are drawn from across the country. For the purposes of the Master Sample the EAs that contained less than 25 households were excluded from the sampling frame, and those that contained between 25 and 99 households were combined with other EAs to form Primary Sampling Units (PSUs). The number of EAs per PSU ranges between one and four. On the other hand, very large EAs represent two or more PSUs.

The sample is designed to be representative at the provincial level and within provinces at the metro/non-metro level. Within the metros, the sample is further distributed by geography type. The four geography types are: urban formal, urban informal, farms and tribal. This implies that for example, that within a metropolitan area the sample is designed to be representative at the different geography types that may exist within that metro.

The current sample size is 3 080 PSUs. It is equally divided into four sub-groups or panels called rotation groups. The rotation groups are designed in such a way that each of these groups has the same distribution pattern as that which is observed in the whole sample. They are numbered from one to four and these numbers also correspond to the quarters of the year in which the sample will be rotated for the particular group.

The sample for the redesigned Labour Force Survey is based on a stratified two-stage design with probability proportional to size (PPS) sampling of primary sampling units (PSUs) in the first stage, and sampling of dwelling units (DUs) with systematic sampling in the second stage.

Sample rotation :

The sampled PSUs have been assigned to 4 rotation groups, and dwellings selected from the PSUs assigned to rotation group "1" are rotated in the first quarter. Similarly, the dwellings selected from the PSUs assigned to rotation group "2" are rotated in the second quarter, and so on. Thus, each sampled dwelling will remain in the sample for four consecutive quarters. It should be noted that the sampling unit is the dwelling, and the unit of observation is the household. Therefore, if a household moves out of a dwelling after being in the sample for, say 2 quarters and a new household moves in then the new household will be enumerated for the next two quarters. If no household moves into the sampled dwelling, the dwelling will be classified as vacant (unoccupied).

Each quarter, $\frac{1}{4}$ of the sampled dwellings rotate out of the sample and are replaced by new dwellings from the same PSU or the next PSU on the list. A total of 3 080 PSUs were selected for the redesigned LFS, and 770 have been assigned to each of the four rotation groups.

Deviations from Sample Design

The sample is designed to be representative at provincial level and within provinces at metro/non-metro level. Within the metros, the sample is further distributed by geography type. The current sample size is 3 080 PSUs. It is divided equally into four subgroups or panels called rotation groups. The rotation groups are designed in such a way that each of these groups has the same distribution pattern as that which is observed in the whole sample. They are numbered from one to four and these numbers also correspond to the quarters of the year in which the sample will be rotated for the particular group.

The sample for the redesigned Labour Force Survey (i.e. the QLFS) is based on a stratified two-stage design with probability proportional to size (PPS) sampling of PSUs in the first stage, and sampling of dwelling units (DUs) with systematic sampling in the second stage. Design effect is defined as the ratio of the variance of an estimate for a complex sample design and the variance of the estimate under the SRS design with the same sample size.

Response Rate

The response rate in South africa for the Quarterly labor Force survey from january to march 2011 is equal to 92.9%.

Response rate by province:

Western Cape - 81.9%
Eastern Cape - 98.9%
Northern Cape - 91.5%
Free State - 95.9%
KwaZulu-Natal - 97.4%
North West - 94.9%
Gauteng - 82.0%
Mpumalanga - 96.2%
Limpopo - 99.5%
South Africa - 92.9%

The response rate in South africa for the Quarterly labor Force survey from april to june 2011 is equal to 92.0%.

Response rate by province:

Western Cape - 83.8%
Eastern Cape - 99.0%
Northern Cape - 90.6%
Free State - 95.6%
KwaZulu-Natal - 96.5%
North West - 95.1%
Gauteng - 79.9%
Mpumalanga - 95.0%
Limpopo - 99.5%

The response rate of LFS 2011 for the second quarter in South africa is equal to 92,0%

The response rate in South africa for the Quarterly labor Force survey from july to september 2011 is equal to 93,5%.

Response rate by province:

Western Cape - 86.8%
Eastern Cape - 98.8%
Northern Cape - 91.8%
Free State - 96.6%
KwaZulu-Natal - 96.8%
North West - 96.5%
Gauteng - 84.8%
Mpumalanga - 95.9%
Limpopo - 99.1%

The response rate of LFS 2011 for the third quarter in South africa is equal to 93,5%

The response rate in South africa for the Quarterly labor Force survey from october to december 2011 is equal to 94,5%.

Response rate by province:

Western Cape - 86.9%
Eastern Cape - 99.2%
Northern Cape - 92.6%
Free State - 97.6%
KwaZulu-Natal - 98.1%
North West - 95.7%
Gauteng - 87.8%
Mpumalanga - 97.1%
Limpopo - 99.2%

The response rate of LFS 2011 for the fourth quarter in South africa is equal to 94,5%

Weighting

The sampling weights for the data collected from the sampled households are constructed so that the responses could be properly expanded to represent the entire civilian population of South Africa. The weights are the result of calculations involving several factors, including original selection probabilities, adjustment for non-response, and benchmarking to known population estimates from the Demographic Division of Stats SA.

Questionnaires

Overview

The questionnaire consists of the following sections:

Section 1 - Biographical information (marital status, language, migration, education, training, literacy, etc.

Section 2 - Economic activities

Section 3 - Unemployment and economic inactivity

Section 4 - Main work activities in the last week

Section 5 - Earnings in the main job

All sections - Comprehensive coverage of all aspects of the labour market

Data Collection Notes

Increasing the frequency of the survey, coupled with the additional requirement to release results in a timely fashion required the following:

- Continuous data collection.
- Automated data processing system.

When collected at different points in time, the data provide the basis for monitoring current trends and changes in the labour market and the employment situation, which may be analysed in connection with other economic and social phenomena to evaluate macro-economic policies. The QLFS nevertheless collects labour market activity data for persons aged 65 years and older. To facilitate continuous data collection, training and fieldwork monitoring from the regional offices across the country, permanent field staff (332) were appointed to conduct the QLFS.

Household members living in approximately 10 000 dwelling units in 1 025 PSUs are interviewed in each of the three months within a quarter. Key information from completed questionnaires is captured by data capturers in the regional office using the RTMS. given month. During this week set-up interviews/publicity and listing maintenance is conducted. Data collection is conducted during the middle two weeks ("11") of each month (except in January and December). The last week ("0") is dedicated to completing the work allocation assigned for that month including the listing of growth areas in the sampled PSU identified during the first week. In summary, the "0" represents a non-data collection week and the "1" represents the two weeks of data collection.

Questionnaires

The questionnaire consists of the following sections:

Section 1 - Biographical information (marital status, language, migration, education, training, literacy, etc.

Section 3 - Unemployment and economic inactivity

Section 4 - Main work activities in the last week

Section 5 - Earnings in the main job

All sections - Comprehensive coverage of all aspects of the labour market

Data Processing

Data Editing

One important innovation that is central to the smooth operation of the entire system is the development of barcodes that are linked to a unique number on each questionnaire. This information provides the link between the information recorded in the Master Sample database and other processes such as editing and imputation as well as weighting and variance estimation. QLFS uses the editing and imputation module to ensure that output data is both clean and complete¹⁰. There are three basic components, called functions, in the Edit and Imputation Module:

- Function A: Record acceptance
- Function B: Edit and imputation
- Function C: Clean up, derived variables and preparation for weighting

Other Processing

Data Processing

Introduction :

The purpose of data processing is to ensure that the information collected from the sampled primary sampling units, dwelling units and households (i.e. the boxes containing QLFS questionnaires) are physically received, stored and processed. The aim is to produce a clean dataset that has all the information contained in the questionnaires. Except for the scanning system, all other elements of the data processing system were developed in-house. One important innovation that is central to the smooth operation of the entire system is the development of barcodes that are linked to a unique number on each questionnaire. This information provides the link between the information recorded in the Master Sample database and other processes such as editing and imputation as well as weighting and variance estimation.

Processing phases :

QLFS data processing is continuous, starting on the second week of every month. Data processing for each quarter must be completed by the first Friday of the subsequent month to ensure that the four-week deadline for publication of the QLFS results is met.

The phases listed below occur sequentially.

Receiving of questionnaires :

The contents of the boxes containing questionnaires sent from the regional offices are verified when received at the DPC. The questionnaire barcodes captured in the provinces are captured again at the DPC to ensure that all questionnaires have been received.

Primary preparation :

The purpose of primary preparation is to ensure that all questionnaires are correctly stacked and positioned prior to being guillotined.

Guillotining:

The purpose of the guillotine process is to cut off the spines of the questionnaires in order to have pages separated for scanning.

Secondary preparation :

The purpose of secondary preparation is to ensure that the questionnaires are correctly stacked and positioned for scanning. At the same time, quality assurance takes place on the work done during the primary preparation and guillotining processes.

Scanning :

The purpose of scanning and recognition is to convert the questionnaires into an electronic format and Tagged Image File Format (TIFF) images.

Verification :

The purpose of scanning verification is to manually correct un-interpretable characters, missing data and errors detected by validation rules.

Electronic coding:

Industry and occupation codes are assigned using the electronic coding system which converts the respondents' industry

and occupation descriptions into numeric codes based on Standard Industry Classification (SIC) and South African Standard Occupation Classification (SASCO). If the system fails to assign a code for either industry or occupation, the coding is assigned manually.

Automated editing and imputation :

QLFS uses the editing and imputation module to ensure that output data is both clean and complete¹⁰. There are three basic components, called functions, in the Edit and Imputation Module:

Function A: Record acceptance

Function B: Edit and imputation

Function C: Clean up, derived variables and preparation for weighting

Function A: Record acceptance

This function is divided into three phases:

First phase: Pre-function A :

The first phase ensures that the records contain valid information in selected Cover Page questions required during edit and imputation and during the subsequent weighting and variance estimation. Any blanks or other errors that need to be corrected are done here before processing of the record can proceed.

Second phase: Function A record acceptance :

The second phase ensures that there is enough demographic and labour market activity information to ensure that editing and imputation can be successfully completed.

Third phase: Post Function A clean up :

This phase ensures that certain data are present where there is evidence that they should be. This for example, involves:

- Ensuring that if there is written material in the job description questions then there are corresponding industry and occupation codes for them.
- Ensuring that partial blanks or non-numeric characters that appear in questions where the Survey Officer is required to enter numbers are validated.
- Ensuring that where there is written material in the space provided for "Other - specify" that the corresponding option is marked.

Function B: Edit and imputation :

Having determined in Function A that the content of the record would support extensive editing and imputation, this function carries out those activities. Editing is the detection of errors in the captured questionnaire. Imputation is the correction of the detected errors.

Function C: Clean up, derived variables and preparation for weighting :

Function C includes all of the "post E&I clean up" functions such as "Off-path cleaning", "Result Code validation", verification of the presence of industry and occupation codes, and the generation of all derived variables.

Electronic data processing systems have been developed to ensure that the key QLFS results are published four weeks after the end of data collection each quarter. The system is fully automated and includes the seven sub-systems discussed in detail in the subsections that follow (9.3.1 to 9.3.6): Real Time Management System (RTMS)

RTMS serves two important functions. Firstly, it is a management tool for personnel involved with field operations to monitor progress. Secondly, it provides an important link between field operations and data processing as follows:

- Ensures that publicity information at the PSU and dwelling unit level can be rapidly assessed, thus allowing for speedy intervention should the need arise.
- Enables the tracking and monitoring of PSU listing books and questionnaires from the provinces to HO as well as through the processing phase.

****Labour Force Survey Microdata Pre-processing:

The process of deriving ILO standardized variables has been applied to the National Labour Force Surveys downloaded from the Microdata Repository. If the microdata set provides all the information required, it can be created up to 34 key variables. To know that these variables have been processed and that they are now in a standardized format that is comparable across microdata, they are called "ilo_XXX". Each key variable has a different name (XXX). All these variables are added at the end of the original microdataset (version 1: 3-dgt ISO_Survey_Year_v01_M_v01_A_ILOVAR_ILO).

Recode note: International classifications based on ISCED, ISIC and ISCO are using, (at certain levels of disaggregation) letters instead of numbers. These letters have been replaced by numbers to keep numerical characters as values.

Nevertheless, labels and categories' boundaries are following international standard classifications.

*****ZAF Microdata Pre-processing

Geographical coverage ('ilo_geo')

Created from variable Geo_type, which distinguishes 1 Urban (set to urban), and 2, 3, 4, Traditional Farms and Mining (set to rural).

Labour Force Status ('ilo_ifs')

Temporary absent, only seasonal waiting and future job starters are set to unemployment.

Education ('ilo_edu')

The criteria used corresponds to completed education, following the ISCED 97 criteria. Doctoral degree and Master's degree cannot be distinguished in the ZAF data, both categories are set to Master's or equivalent. Completing a higher or equal educational level is assumed to validate the lack of lack of completion for an inferior or equal level. The following table describes the detailed definitions used.

NB: For more information, please find attached the document (Note on Dataset) joint on the related materials.

Occupation ('ilo_job1_ocu_isco88_2digits')

(Previous occupation ('ilo_prevocu_isco88') follows from the same procedure)

The underlying data is broadly consistent with ISCO-88, nonetheless some discrepancies arise. The method to achieve the correspondence is the following:

1 When possible a direct mapping is established.

2 When the 4 digit categories coincide in the content but not in the code the latter is adjusted.

3 When the ZAF data presents 4 digit categories non-existent in the ISCO 88 the code is reduced to two digit.

Additionally there are several 4 digit ISCO88 categories not present in ZAF data. The resulting correspondence can be seen in the table below, with perfect correspondences not shown.

NB: For more information, please find attached the document (Note on Dataset) joint on the related materials.

Economic activity ('ilo_eco')

(Previous economic activity ('ilo_preveco') follows the same procedure)

Since the ZAF data is only partly compatible with ISIC 3, the table below describes the used mapping of ZAF data to ISIC 3.1 division. The 2 digit level ISIC 3.1 is not obtained due to compatibility issues.

NB: For more information, please find attached the document (Note on Dataset) joint on the related materials.

Formal / Informal Economy ('ilo_job1_ife_prod' 'ilo_job1_ife_nature')

The variables used to compute the formality of both sector and employment are: institutional sector of the unit of production, business registration for national tax purposes, contribution of the employer to a social security scheme or pension fund, availability of paid holiday leave and availability of paid sick leave. These are the variables available from ZAF data that are included in the framework to determine formality.

With respect to formal or informal sector. Employed respondents working for the public sector (including government controlled business) are considered to be working in the formal sector. So do persons employed at businesses registered for tax purposes, finally, employees working in businesses that are not registered but that provide access to a social security scheme or pension fund are also considered to be employed in the formal sector. Respondents that report working for a private household are classified as working in the household sector. The informal sector is composed by: employees in unregistered businesses with no access to social security and the rest of workers in unregistered businesses.

With respect to formal or informal employment. Employees and workers without status with access to a social security scheme or a pension fund are considered to be in formal employment, those with no access or no knowledge about such scheme are considered in informal employment. Employers and own account workers are considered to be in formal or informal employment in the measure that they are considered to work in the formal or informal sector respectively. Finally contributing family workers are considered to be informally employed.

Incomplete or no data

Disability status ('ilo_dsb')

Not available as a general population question (only given as a reason of unemployment/not starting a business).

Monthly labour related income ('ilo_joball_lri')

Present in the questionnaire yet not available in the micro data set.

Occupational injury ('ilo_joball_inj', 'ilo_joball_oi_case', 'ilo_joball_oi_day')

Not available.

Data Appraisal

Estimates of Sampling Error

Variance estimation:

The most commonly used methods for estimating variances of survey estimates from complex surveys, such as the QLFS, are the Taylor Series Linearization, Jackknife Replication, Balanced Repeated Replication (BRR), and Bootstrap methods (Wolter, 2007)¹. We implemented the replication method for the QLFS mainly because of simplicity. The QLFS sampled 3 080 PSUs by selecting an even number of 4 or more PSUs from within strata. The Jackknife method would be applicable for the sample design with more than two PSUs per stratum, but this would result in 3 080 replicates, which would be computationally very intensive. The Fay's BRR method on the other hand is applicable when two primary sampling units (PSUs) are sampled from each stratum. Therefore we decided to use Fay's BRR method by collapsing PSUs into two groups of PSUs within each stratum.

Other measures of precision:

In practice, the sampling variance itself is hardly ever reported. Instead, users find it more useful to rely on one of the derivatives of the sampling variance, such as the standard error, the coefficient of variation, the margin of error, or the confidence interval. These are all related expressions, and it is quite easy to go from one to the other using simple mathematical operations.

Other forms of Data Appraisal

Because estimates are based on sample data, they differ from figures that would have been obtained from complete enumeration of the population using the same instrument. Results are subject to both sampling and non-sampling errors. Non-sampling errors include biases from inaccurate reporting, processing, and tabulation, etc., as well as errors from non-response and incomplete reporting.

These types of errors cannot be measured readily. However, to the extent possible, non-sampling errors can be minimised through the procedures used for data collection, editing, quality control, and non-response adjustment. The variances of the survey estimates are used to measure sampling errors. The variance estimation methodology is discussed below.
