### ABSTRACT

The Labor Force Survey (LFS) aims to provide a quantitative framework for the preparation of plans and formulation of policies affecting the labor market. Specifically, the survey is designed to provide statistics on levels and trends of employment, unemployment and underemployment for the country, as a whole, and for each of the administrative regions, including provinces and key cities.

### KIND OF DATA

Sample survey data [ssd]

### UNITS OF ANALYSIS

The unit of analysis includes only individuals.

## Scope

---

### NOTES

The scope of this survey includes:

For All Persons

- Relationship to the Household Head
- Age as of Last Birthday
- Marital Status

- Highest Grade Completed

For Employed Persons

- Main Activity/Usual Occupation During the Past Twelve Months
- Primary Occupation
- Kind of Industry/Business
- Class of Worker
- Nature of Employment
- Normal Working Hours Per Day During the Past Week
- Total Hours Worked During the Past Week

- Whether Wanting More Hours of Work

For Persons Who Had No Job/Business

- Job Search Method

- Number of Weeks Looking for Work

# Sampling

## Sampling Procedure

---

The sampling design of the Labor Force Survey (LFS) uses the sampling design of the 2003 Master Sample (MS) for Household Surveys that started July 2003.

### Sampling Frame

As in most household surveys, the 2003 MS used an area sample design. The Enumeration Area Reference File (EARF) of the 2000 Census of Population and Housing (CPH) was utilized as sampling frame. The EARF contains the number of households by enumeration area (EA) in each barangay. This frame was used to form the primary sampling units (PSUs). With consideration of the period for which the 2003 MS will be in use, the PSUs were formed/defined as a barangay or a combination of barangays with at least 500 households.

### Stratification Scheme

Stratification involves the division of the entire population into non-overlapping subgroups called strata. Prior to sample selection, the PSUs in each domain were stratified as follows:

- 1) All large PSUs were treated as separate strata and were referred to as certainty selections (self-representing PSUs). A PSU was considered large if it has a large probability of selection.
- 2) All other PSUs were then stratified by province, highly urbanized city (HUC) and independent component city (ICC).
- 3) Within each province/HUC/ICC, the PSUs were further stratified or grouped with respect to some socio-economic variables that were related to poverty incidence. These variables were: (a) the proportion of strongly built houses (PSTRONG); (b) an indication of the proportion of households engaged in agriculture (AGRI); and (c) the per-capita income (PERCAPITA).

### Sample Selection

To have some control over the subsample size, the PSUs were selected with probability proportional to some estimated measure of size. The size measure refers to the total number of households from the 2000 CPH. Because of the wide variation in PSU sizes, PSUs with selection probabilities greater than 1 were identified and were included in the sample as certainty selections.

At the second stage, enumeration areas (EAs) were selected within sampled PSUs, and at the third stage, housing units were selected within sampled EAs. Generally, all households in sampled housing units were enumerated, except for few cases when the number of households in a housing unit exceeds three. In which case, a sample of three households in a sampled housing unit was selected at random with equal probability.

An EA is defined as an area with discernable boundaries within barangays, consisting of about 150 contiguous households. These EAs were identified during the 2000 CPH. A housing unit is a structurally separate and independent place of abode which, by the way it has been constructed, converted, or arranged, is intended for habitation by a household.

### Sample Size

The 2003 Master Sample consist of a sample of 2,835 PSUs of which 330 were certainty PSUs and 2,505 were non certainty PSUs. The number of households for the 2000 CPH was used as measure of size. The entire MS was divided into four sub-samples or independent replicates, such as a quarter sample contains one fourth of the PSUs found in one replicate; a half-sample contains one-half of the PSUs in two replicates. Thus, the survey covers a nationwide sample of about 51,000 households deemed sufficient to measure the levels of employment and unemployment at the national and regional levels.

### Strategy for non-response

Replacement of sample households within the sample housing units is allowed only if the listed sample households had moved out of the housing unit. Replacement should be the household currently residing in the sample housing unit previously occupied by the original sample.

## Deviations from Sample Design

---

Starting the July 2003 round of the Labor Force Survey, the generation of the labor force and employment statistics adopted

the 2003 Master Sample Design.

- Using this new master sample design, the number of samples increased from 41,000 to around 51,000 sample households.

- The province of Basilan is grouped under Autonomous Region in Muslim Mindanao while Isabela City (Basilan) is now grouped under Region IX. This is to adopt the regional grouping under Executive Order No.36.

- The 1992 four-digit code for Philippine Standard Occupational Classification (PSOC) and 1994 Philippine Standard Industry Classification (PSIC) were used in classifying the occupation and industry.

## Response Rate

---

Labor force population in January 2003 increased by 1.8 percent to 33.7 million from 33.1 million in January last year. Labor force participation rate slightly declined by 0.7 percentage point, from 66.4 percent in January 2002 to 65.7 percent in January this year.

Labor force population in April 2003 decreased by 1.2 percent to 34.6 million from 35.1 million in April last year. The labor force participation rate, likewise, declined by 2.8 percentage points, from 69.9 percent in April 2002 to 67.1 percent in April this year.

The labor force participation rate was reported at 67.4 percent in July this year. A year ago, it was 67.1 percent. The July 2003 results indicated a national employment rate of 87.3 percent. Last year's employment rate was 88.8 percent.

The October 2003 Labor Force Survey results recorded a labor force participation rate (LFPR) of 67.1 percent. The unemployment rate was estimated at 10.1 percent in October this year. Last year's unemployment rate was 10.2 percent.

## Weighting

---

Calculation of Basic Weights:

Following a standard approach, the weights to be used in analyzing surveys based on the 2003 MS are developed in three stages.

First, base weights are computed to compensate for the unequal selection probabilities in the sample design.

Second, the base weights are adjusted to compensate for unit non-response.

Third, the non-response adjusted weights are further adjusted to make some weighted sample distributions to conform to some known population totals.

Final Survey Weight

The final survey weight assigned to each responding unit is computed as the product of the base weight, the non-response adjustment, and the population weighting adjustment. The final weights should be used in all analyses to produce valid estimates of population parameters.

More detailed explanation on the estimation procedure is provided in the Technical Documents.

# Questionnaires

## Overview

---

ISH Form 2 (LFS questionnaire) is a four-page, forty four-column questionnaire that is being used in the quarterly rounds of the Labor Force Survey nationwide. This questionnaire gathers data on the demographic and economic characteristics of the population.

On the first page of the questionnaire, the particulars about the geographic location, design codes and household auxiliary information of the sample household that is being interviewed are to be recorded. Certifications by the enumerator and his supervisor regarding the manner by which the data are collected are likewise to be made on this page.

The inside pages of the questionnaire contain the items to be determined about each member of the sample household. Columns 2 to 11 are for the demographic characteristics; columns 2 to 7A are to be ascertained of all members of the household regardless of age. Columns 8 to 9 are asked for members 5 years old and over, while column 10 is asked for members 5 to 24 years old, column 11, for 15 years old and over, while columns 12 to 16 are asked for members 5 years old and over. Items 18 to 44 on the other hand, are the series of items that will be asked of all the members 15 years old and over to determine their labor force and employment characteristics.

Most of the questions have pre-coded responses. The possible answers with their corresponding codes are printed at the bottom of the page for easy reference. Only the appropriate codes need to be entered in the cells. Other items, however, require write-in entries such as column 14 (primary occupation) and column 16 (kind of business/industry), etc. For such items, it is required that the enumerator describes the primary occupation or kind of business/industry.

## Data Collection

### Data Collection Mode

### Data Collection Notes

Personal interview is deemed most applicable for the LFS owing to the complexity of the questionnaire, the details required, and the level of education of respondent in sample households. NSO Statistical Coordination Officers/Assistants (SCOs/ASCOS) and Statistical Researchers served as interviewers during the operations. Supervision and monitoring of survey operations were done by the Regional Administrators/Provincial Statistics Officers of NSO, most of whom have experience and have undergone training on various types of surveys and censuses.

There were three levels of training:

- The first level involves the training of task force members conducted at the Central Office participated by selected central office personnel, selected regional or provincial staff.
- The second level training was held at the Regional Offices participated by the Provincial Statistical Officers, Regional Statisticians, and Provincial Statisticians. Regional or provincial staff who attended the Task Force Training will act as trainers during the second level training.
- The third level training was held at the Provincial Offices participated by the District Statistics Officers, Statistical coordination Officers and hired Statistical Researchers. The provincial staff who attended the second level training will act as trainers in this level of training.

Enumeration:

The enumeration period started start on the second week up to the end of the survey month including Saturdays. The total mandays given to each enumerator to complete his/her workload will depend on the assigned sample areas but must not go beyond 21 days.

- All households from the sample barangays/EAs had been administered with the LFS questionnaire (ISH Form 2) with an output of six to eight households per day.
- A courtesy call to the head of the Barangay were done to inform that there is an on-going survey in their area.
- A detailed instructions on how to deal with problems encountered during enumeration is included as Technical Documents.

## Supervision

---

### Training:

There were three levels of training:

The first level involves the training of task force members conducted at the Central Office participated by selected central office personnel, selected regional or provincial staff.

The second level training was held at the Regional Offices participated by the Provincial Statistical Officers, Regional Statisticians, and Provincial Statisticians. Regional or provincial staff who attended the Task Force Training will act as trainers during the second level training.

The third level training was held at the Provincial Offices participated by the District Statistics Officers, Statistical coordination Officers and hired Statistical Researchers. The provincial staff who attended the second level training will act as trainers in this level of training.

The Regional Directors/Officer-In-Charge (RDs/OICs), Provincial Statistics Officers (PSOs), Regional and Provincial Staff were allotted a number of days to supervise the enumeration.

- 1) The RD/OIC coordinates with the PSOs and provides the general supervision to the staff of the provincial offices under the jurisdiction on all administrative matters and field operations relative to the survey.
- 2) The PSO supervises the activities of the personnel to ensure that the data collection is finished according to the timetable set.
- 3) The Regional and Provincial Statistician supervise in the field and ensure that all items in the questionnaire were asked, and review and edit questionnaires while still in their area of assignment and ensure that all sample households have corresponding questionnaire.

Central Office Statisticians were assigned to provinces to supervise and monitor the conduct of the survey.

## Data Processing

### Data Editing

---

Editing is meant to correct these errors. For purposes of operational convenience, field editing is usually done. The interviewers are required to review the entries at the end of each interview. Blank items which are applicable to the respondents are verified and filled out. Before being transmitted to the central office, all questionnaires are edited in the field offices. Coding, the transformation of information from the questionnaire to machine readable form, is likewise done in the field offices.

Machine editing is preferred to ensure correctness of encoded information. Except for sample completeness check and verification of geographic identification which are the responsibility of the subject matter division, some imputations and corrections of entries are done mechanically.

### Other Processing

---

Data processing involves two stages: manual processing and machine processing. Manual processing refers to the manual editing and coding of questionnaires. This is done prior to machine processing which entails code validation, consistency checks as well as tabulation. Enumeration is a very complex operation and oftentimes it happens that accomplished questionnaires have some omissions and implausible or inconsistent entries. Editing is meant to correct these errors. For purposes of operational convenience, field editing is usually done. The interviewers are required to review the entries at the end of each interview. Blank items which are applicable to the respondents are verified and filled out. Before being transmitted to the central office, all questionnaires are edited in the field offices.

Coding, the transformation of information from the questionnaire to machine readable form, is likewise done in the field offices. Machine processing involves all operations that are done with the use of a computer and/or its accessories, that is, from data encoding to tabulation. Coded data are usually in such media as tapes and diskettes.

Machine editing is preferred to ensure correctness of encoded information. Except for sample completeness check and verification of geographic identification which are the responsibility of the subject matter division, some imputations and corrections of entries are done mechanically. Further machine processing for this round, is done at the central office of the National Statistics Office.

## Data Appraisal

### Other forms of Data Appraisal

The official methodology was deemed the most appropriate among methodologies reviewed and evaluated for the following reasons: a) it captures the labor and employment situation in all four quarters of the year; b) the generation or cross tabulations (e.g., by class of workers, by occupation group) is more feasible for producer of estimates; c) it is the closest method for estimating the number of persons who work four times for the entire year; and d) these estimates are being used by the Department of Labor and Employment (DOLE) and its attached agencies and regional offices for planning/formulation of intervention programs.
