Overview

ABSTRACT

Sakernas is a survey which is specifically designed for labor data collection. Sakernas is relatively different

compared with SP (Population Census) and Supas (Intercensal Population Census) which are more focused on demographic characteristics of the population. Other labor force data source is Susenas (National Social and Economic Survey) which collects data on many aspects of social and economic characteristics, such as: consumption, labor, health and household variables. The differences in the characteristics coverage of surveys/census mentioned above are contributed to the labor data quality, in which the Sakernas results are regarded better.

The purpose of collecting data through this survey is to provide basic and continuous data on employment on a quarterly basis. More specifically, the objective of this survey is to obtain information on the working age population, the unemployed, the inhabitants of the country who have quit work or moved, and estimate the unemployment trends at the district, municipal, provincial and national level.

Sampling

Sampling Procedure

The difference of sample size of Sakernas compared with other surveys mentioned above (SP, Supas and Susenas) will also lead to different levels of sampling error. The smaller sample size will cause the greater sampling error of a survey.

Sampling frame: Population census

Lowest level of geographic disaggregation for which reliable estimates of the unemployment rate can be produced and their frequency: Province (quarterly)

The sample is stratified: Yes

Variables used for stratification: socio-economic characteristics: sex

Ultimate sampling units: households
