There are between 50 to 70 million (20 to 30%) indigenous people living in Indonesia. The government of Indonesia recognizes 1128 ethnic groups, of which some are identified as "komunitas adat terpencil" (geographically isolated indigenous groups) by the ministry of social affairs.

The traditional livelihood of Indonesian indigenous people is being threatened by various factors, including encroachment on their lands through slash and burn forest clearing for agriculture, illegal timber exploitation and mining, drainage of peat land as well as climate change. In 2007, Indonesia’s deforestation rate ranked second fastest in the world and the majority of pulpwood plantations coming from natural forest conversions.

The indigenous people ex-mega rice project (EMRP) areas face high incidences of poverty and poor access to sustainable livelihoods, as well as severe environmental degradation. Forest and peatland restoration was deemed necessary to support sustainable livelihoods and eco-system services.

This project was implemented by ILO Jakarta with technical backstopping from the Employment Intensive Investment Program in partnership with REDD+, the Ministry of Manpower and Transmigration, the Ministry of Public Works, Indigenous, employers and worker’s organizations.

The immediate objective of the project was to introduce local resource-based approaches through local capacity building in order to rehabilitate degraded forest land, promoting sustainable livelihood development and improving access to socio-economic facilities and markets.

The project comprised of three interrelated components:

- Demonstration of the relevance of environmental infrastructure to support adaptation to climate change using participatory local resource-based approaches and techniques,
- Increased capacity of communities and local authorities to improve access to socio-economic facilities and markets in rural areas in support of sustainable livelihoods through meaningful participation in decision-making processes and local resource-based strategies,
- Introducing a participatory model for green value chain development and sustainable livelihoods is introduced through improving the capacity of local stakeholders.

Despite its short time-frame, the project was implemented in five rural villages in central Kalimantan and used a community based participatory approach to bring about tangible impact. This helped drawing on traditional
indigenous knowledge and practices, consultation and fostered participation of the beneficiary communities at all stages of the project.

**Achievements**

The project increased the capacity of communities and local authorities and improved access to socioeconomic facilities and markets in rural areas. It supported the creation of sustainable livelihoods through meaningful participation in decision-making processes and local resource-based strategies.

The participatory, community-based, approaches of the project planning, implementation and monitoring contributed strongly to build awareness related to forest degradation, broad-based community engagement in rehabilitation interventions and capturing local needs and priorities.

As such, the project addressed the two most pressing needs of the indigenous peoples; land rights and sustainable livelihoods. The planting of trees was not only used to rehabilitate the land, but also to mark the traditional boundaries of the area of the Dayaks. It was used as a means to stop companies of claiming the land for palm oil production, stating it is "unused land", as well as to indicate to the government that concessions should not be given for this area. The capacity building and awareness raising workshops on land rights for the local villagers as part of this programme were particularly beneficial in this respect.

Agroforestry practices were introduced and in all villages 3 to 5 fish-ponds were constructed. In four villages small infrastructure works had been constructed in all villages. Local people were hired as worker, generating income and providing decent work opportunities as well as training during the project. As such the project also enabled the transfer of technical skills and knowledge of on fish farming, agroforestry, marketing of products and business development.

The project also managed to involve women in all activities by setting a quota for women. In every coordinating committee, it was decided that at least one out of three members should be a woman, and in workshops and implementation activities at least 40% of the participants were women.

The project also provided support to and work in partnership with local indigenous CSOs/NGOs, employers' and workers' organizations, in order to simultaneously consolidate the collaboration between ILO and the Government of Indonesia.

**The Employment-Intensive Investment Program**

EIIP supports ILO member States in the design, formulation, implementation, and evaluation of policies and programmes aiming to address unemployment and underemployment through public investment, typically in infrastructure development.

EIIP is part of the ILO’s Employment Policy Department and has evolved over the past 40 years from a series of labour-intensive infrastructure programmes to a comprehensive and integrated package of interventions which contributes to both the provision of improved and climate resilient infrastructure, and the creation of decent jobs. EIIP influences public investments to become more employment-oriented through knowledge development, capacity building, and technical advisory services at policy, institutional and operational levels.
